# Frustrating golf ball 

It often happens that a golf ball escapes from the hole an instant after it has been putted into it. Explain this phenomenon and investigate the conditions under which it can be observed.

Vyacheslav Matyunin, Russia

## Size of the ball and the hole

Diameter of the ball $=42.7 \mathrm{~mm}$ Diameter of the hole $=108 \mathrm{~mm}$

## Characteristic velocity

$$
\begin{aligned}
W & =\sqrt{2 g r}=\sqrt{g d}=65 \mathrm{~cm} / \mathrm{s} \\
\frac{V}{W} & =\frac{D}{d} \longrightarrow V=164 \mathrm{~cm} / \mathrm{s}
\end{aligned}
$$

## "Interactive Physics" computer simulation of central impact

On this video:

- Coefficient of restitution $\varepsilon=0.2$
- Coefficient of sliding friction $\mu=0.3$
- Velocity of the ball $V=1.85 \mathrm{~m} / \mathrm{s}$

## Results of the computer simulation

## Critical velocity V (cm/s):

|  |  | Coefficient of restitution $\varepsilon$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 0 | 0.1 | 0.2 |
|  | 0 | 1.67 | 1.76 | 1.85 |
|  | 0.1 | 1.65 | 1.75 | 1.85 |
|  | 0.2 | 1.64 | 1.74 | 1.85 |
|  | 0.3 | 1.63 | 1.73 | 1.85 |
|  | 0.4 | 1.63 | 1.73 | 1.85 |

## Central impact: critical velocity vs. restitution

Coefficient of slide friction $\mu=0.3$

## Impact of the rotating ball with a wall

Regime of full connection
Regime of non-full connection

$$
\begin{aligned}
u^{\prime} & =\frac{5}{7} u+\frac{2}{7} \omega r \\
\omega^{\prime} & =\frac{2}{7} \omega+\frac{5}{7} \cdot \frac{u}{r}
\end{aligned}
$$

$$
\begin{gathered}
u^{\prime}=u+\mu(1+\varepsilon) v \\
\omega^{\prime}=\omega-\frac{5 \mu(1+\varepsilon)}{2} \cdot \frac{v}{r}
\end{gathered}
$$

## Two regimes of impact

## Experimental setup

The velocity of the ball and the impact parameter defined using a slide.

# The field of artificial grass, the hole and rails 

Coefficient of sliding friction $=0.3$ Coefficient of restitution $=0.2$

## Calibration of the slide

Velocity of the ball

$$
V=L \sqrt{\frac{g}{2 H}}
$$

under the condition

$$
\begin{aligned}
V & \geq \sqrt{g r}= \\
& =31 \mathrm{~cm} / \mathrm{s}
\end{aligned}
$$

## Centre impact (480 fps)

This regime was studied in "Interactive physics"

## Off-centre impact (480 fps)

For this regime a simple model could be created

## The ball rolls on the rim

$$
\begin{gathered}
\frac{v^{2}}{\delta}=g \cdot \operatorname{tg} \alpha \\
v^{2}=\frac{g \delta}{\sqrt{\left(\frac{r}{R-\delta}\right)^{2}-1}}
\end{gathered}
$$

# Experimental boundary of the capture region 

# Centre impact (Solid Works) 

# Off-centre impact (Solid Works) 

## Results of "Solid Works"

 computer simulation

## Real experiment and computer simulation

Real experiment: the edge is soft

Computer simulation: the edge is rigid

## Summary

- Characteristic velocity
- 2-D simulation in "Interactive Physics"
- Experimental setup
- Boundary of the capture region
- Regimes of an impact
- Model for the rolling regime
- 3-D simulation in "Solid Works"
