

# 15. MENISCUS OPTICS

---

Nikola Illášová

# TASK

Cut a **narrow slit** in a thin sheet of opaque material.

Immerse the sheet in a **liquid** such as water.

After removing the sheet from the liquid, you will see a liquid film in the slit.

Illuminate the slit and study the resulting pattern.

# EXPERIMENTAL APPARATUS

Laser

Lenses to  
enlarge the beam

Slit – horizontal  
position

Screen

# PATTERNS – NO LIQUID

Let's add the liquid...

Laser beam

Laser beam  
broadened by lenses

Very thin slit

# PATTERNS – WITH LIQUID

Laser beam

Laser beam  
broadened by lenses

Very thin slit

# LIQUID – DIVERGING LENS

This could explain the patterns...is it the real shape?

# SHAPE OF THE LIQUID FILM

Determined by:

- Pressure difference
- Surface tension

In equilibrium

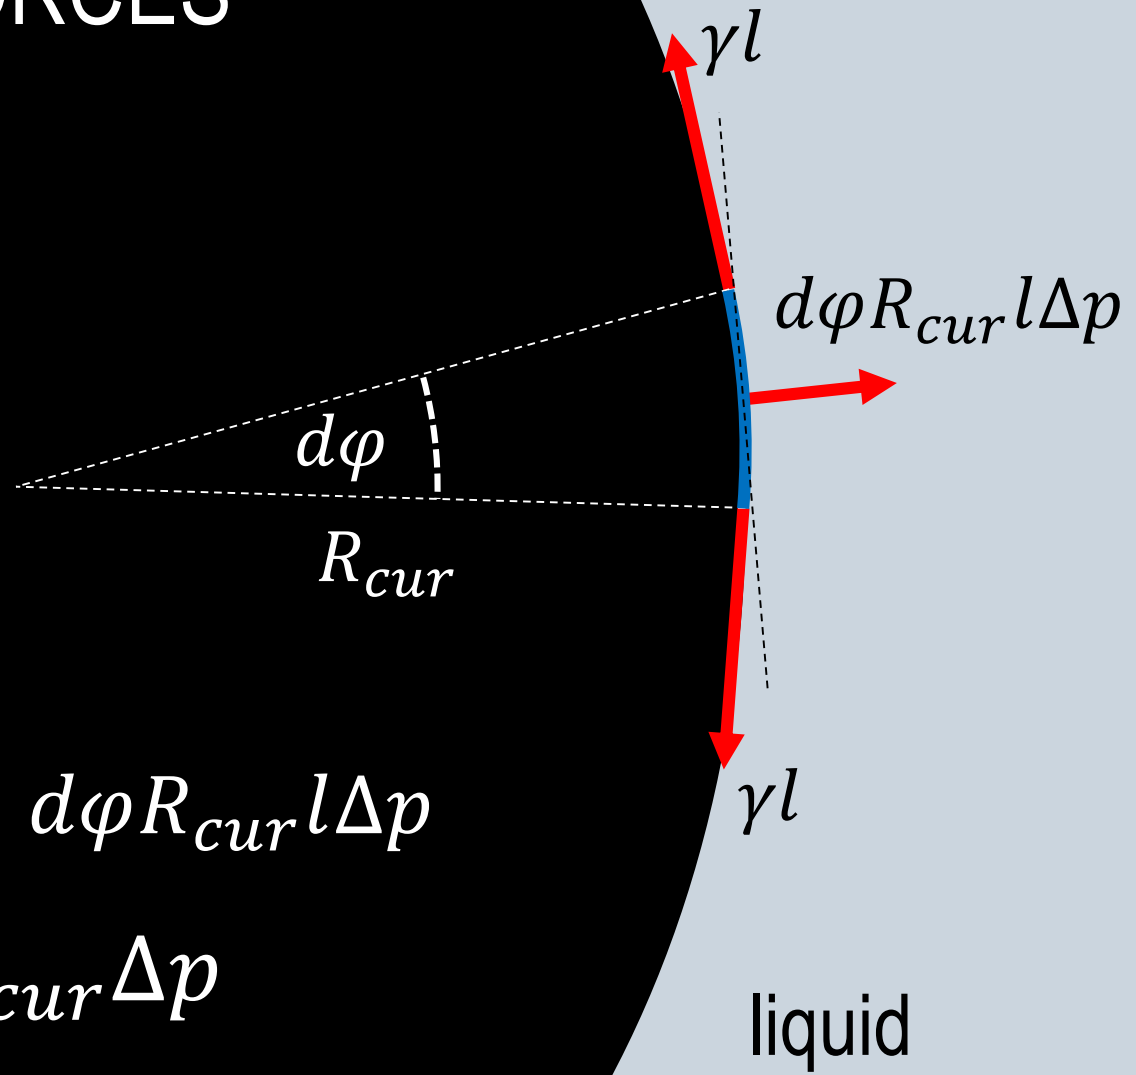

# BALANCE OF FORCES

- Pressure difference
- Surface tension

- Forces equilibrium:

$$2\gamma l \sin \frac{d\varphi}{2} = d\varphi R_{cur} l \Delta p$$

$$\gamma = R_{cur} \Delta p$$

# HEIGHT – CURVATURE RELATION

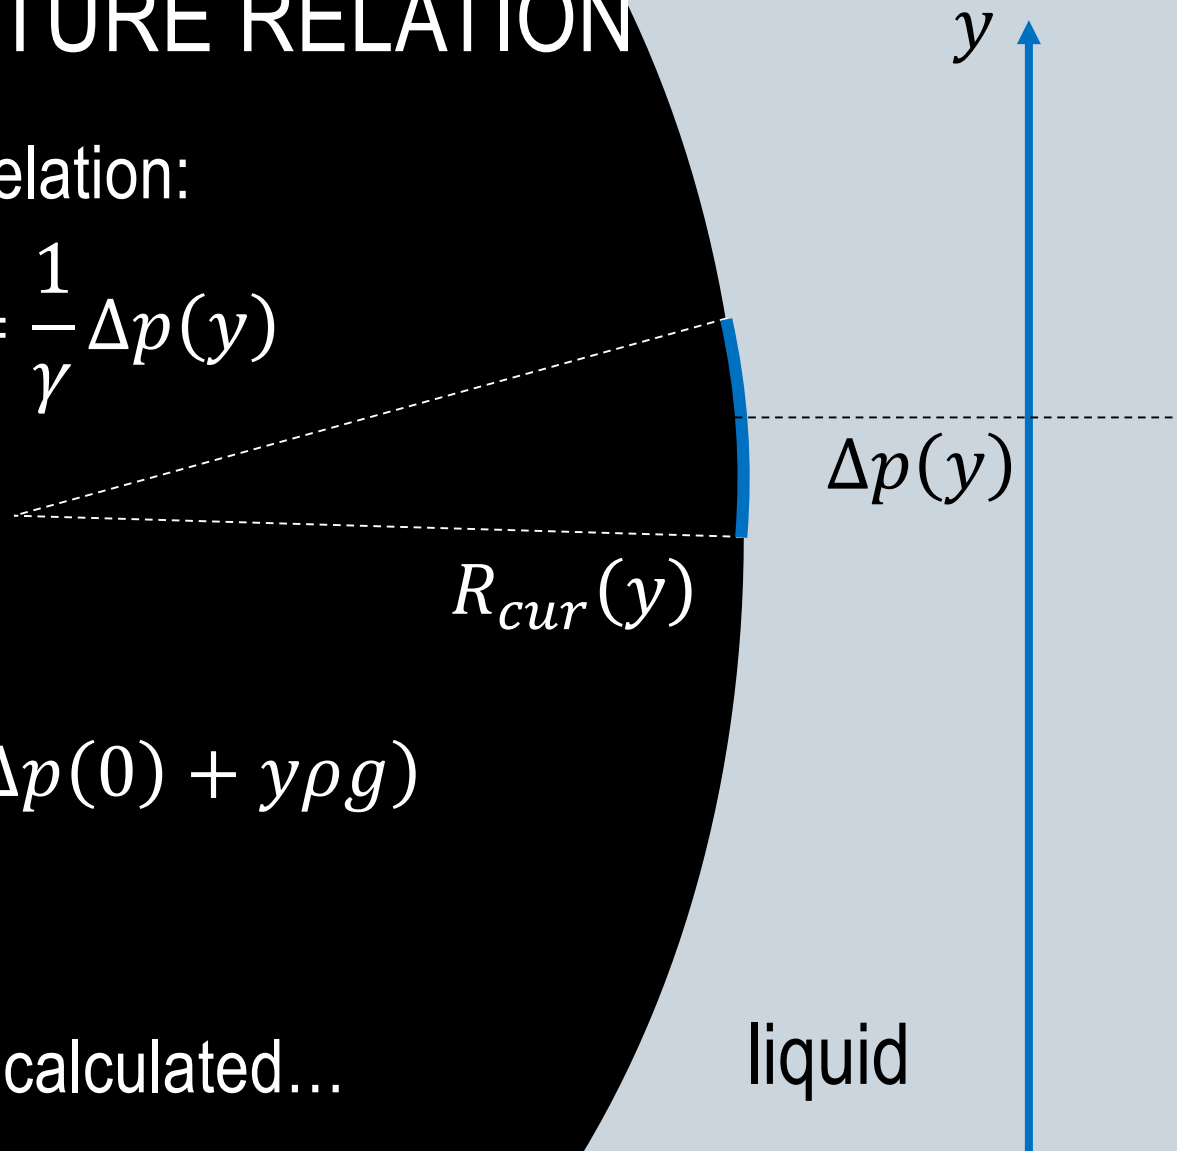

Curvature – pressure relation:

$$\frac{1}{R_{cur}(y)} = \frac{1}{\gamma} \Delta p(y)$$

Hydrostatic pressure:

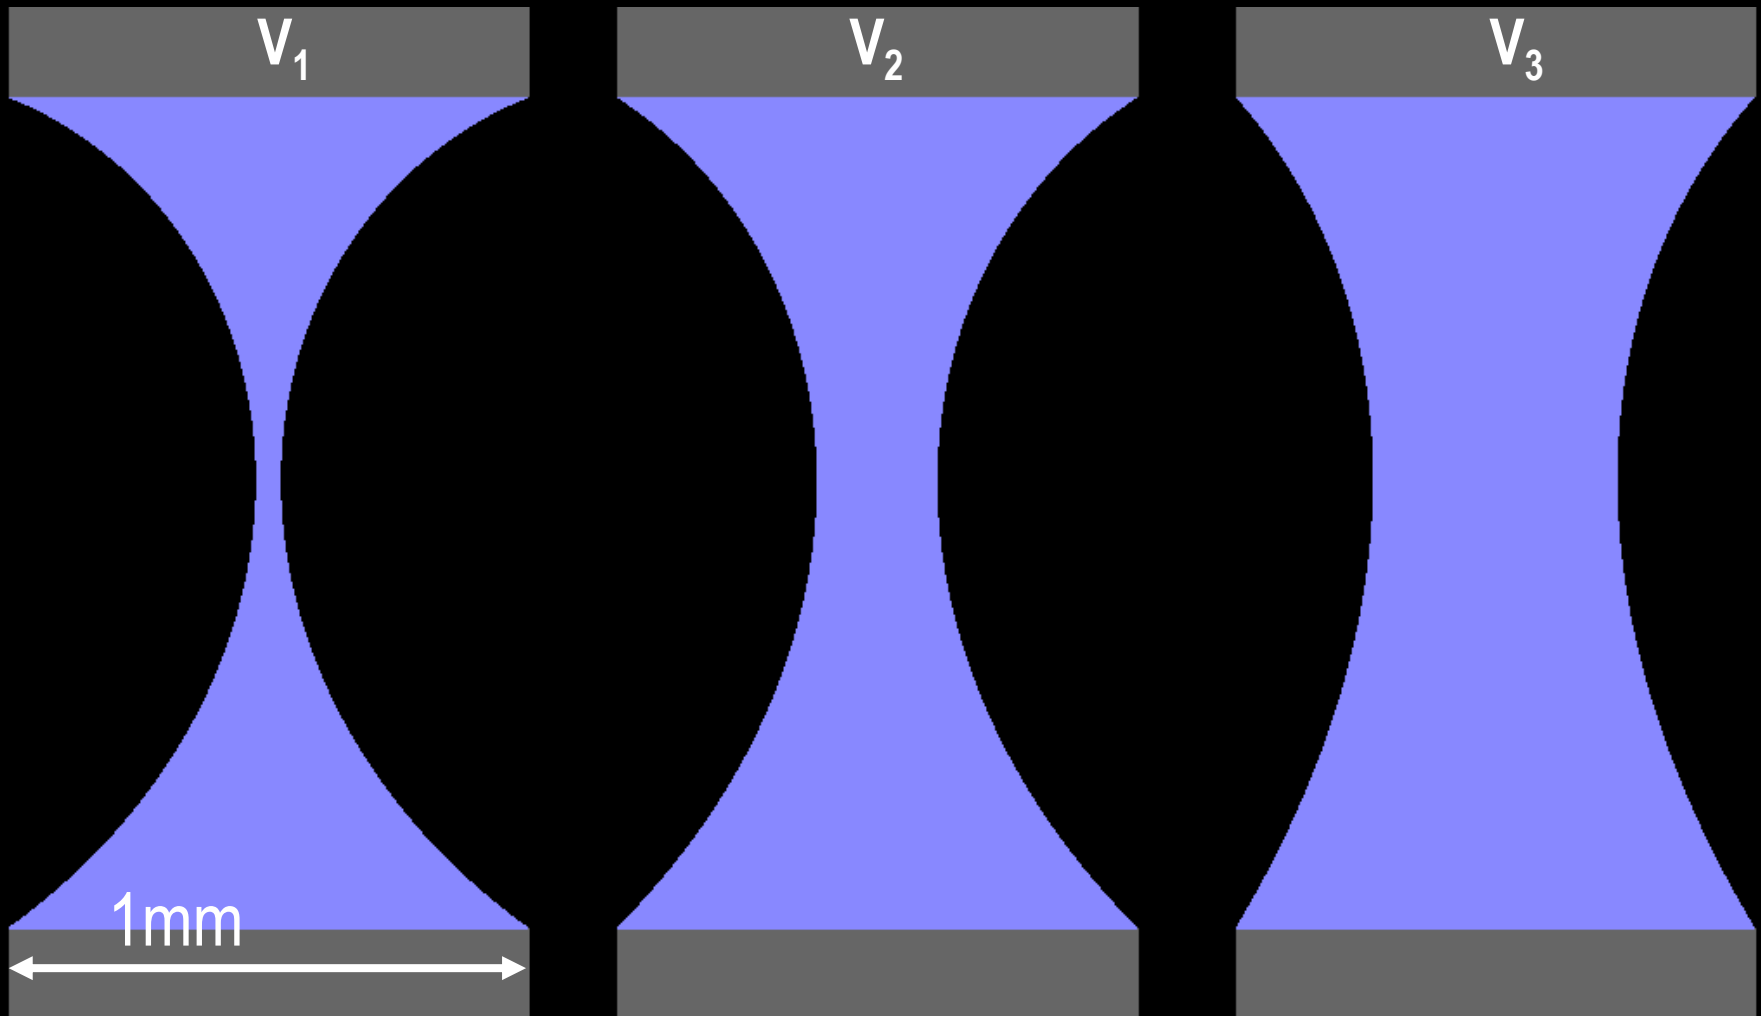

$$\frac{1}{R_{cur}(y)} = \frac{1}{\gamma} (\Delta p(0) + y\rho g)$$

Now the shape can be calculated...

# SHAPES DEPEND ON VOLUME OF LIQUID

FREE PARAMETER – unknown volume of liquid drains due to gravity

# SIMULATION

Find the shape	Thickness [mm] 1
Meniscus picture	Film thickness [mm] 1
Save picture	Film position [mm] 0
Draw several rays	Width [mm] 1
Number of rays 50	Slope at the bottom -1
Max and min angles	Height increment [mm] 0.0001
horny luc uhol dolny luc uhol	Gravity [m/s <sup>2</sup> ] 9.81
Vertical slit pattern	Screen distance [m] 0.1
Angle [deg] 70	Scale [pix/m] 200000
Bending pattern	Area [m <sup>2</sup> ] 0.0000005
Curvature [m <sup>-1</sup> ]	
Bending curvature	
Constant volume	

# REFRACTION OF LIGHT

- We know the shape, Snell's law of refraction

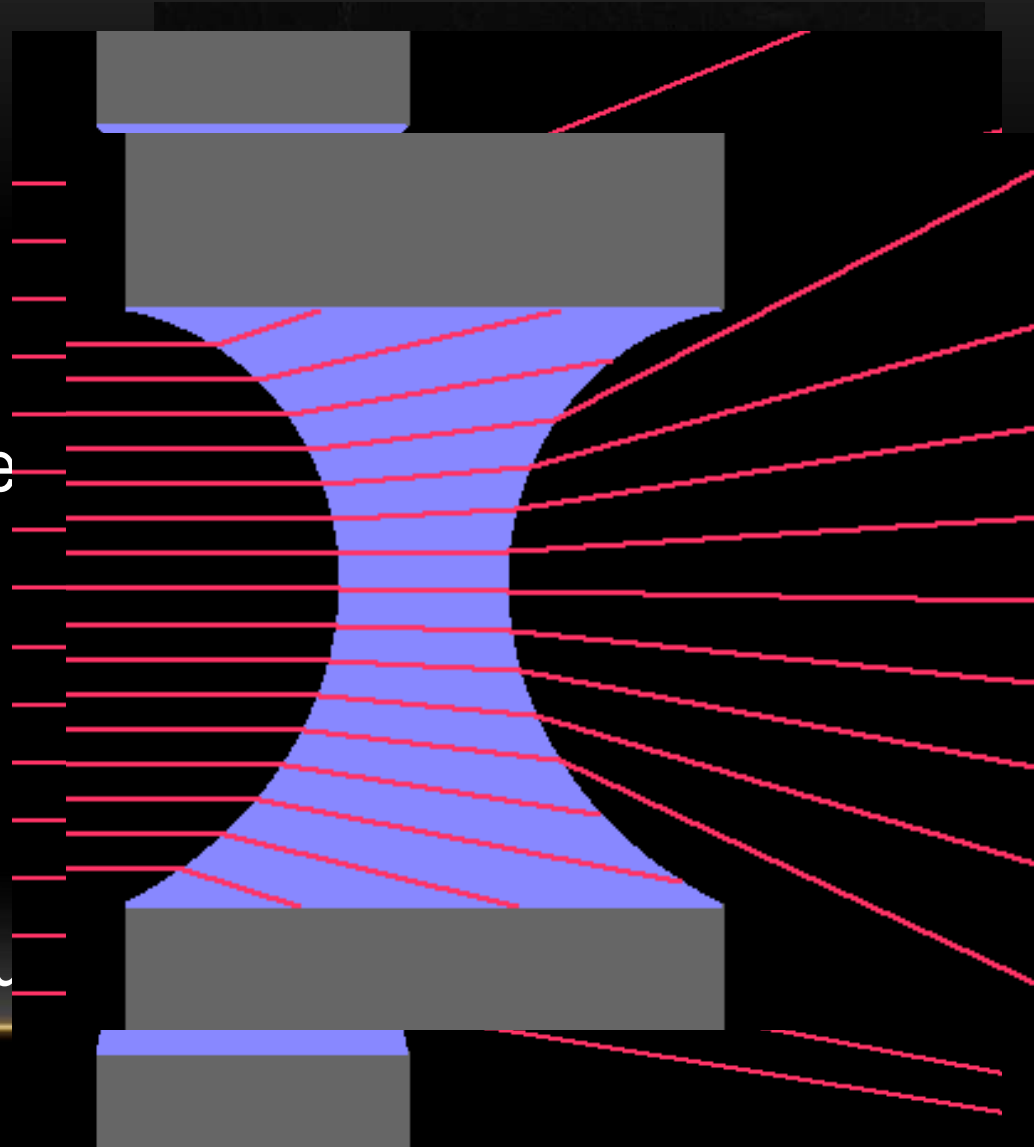

# MENISCUS VS. LENS

Lenses are...

- Thin
- Horizontally symmetrical
- Radius of curvature  $\gg$  size

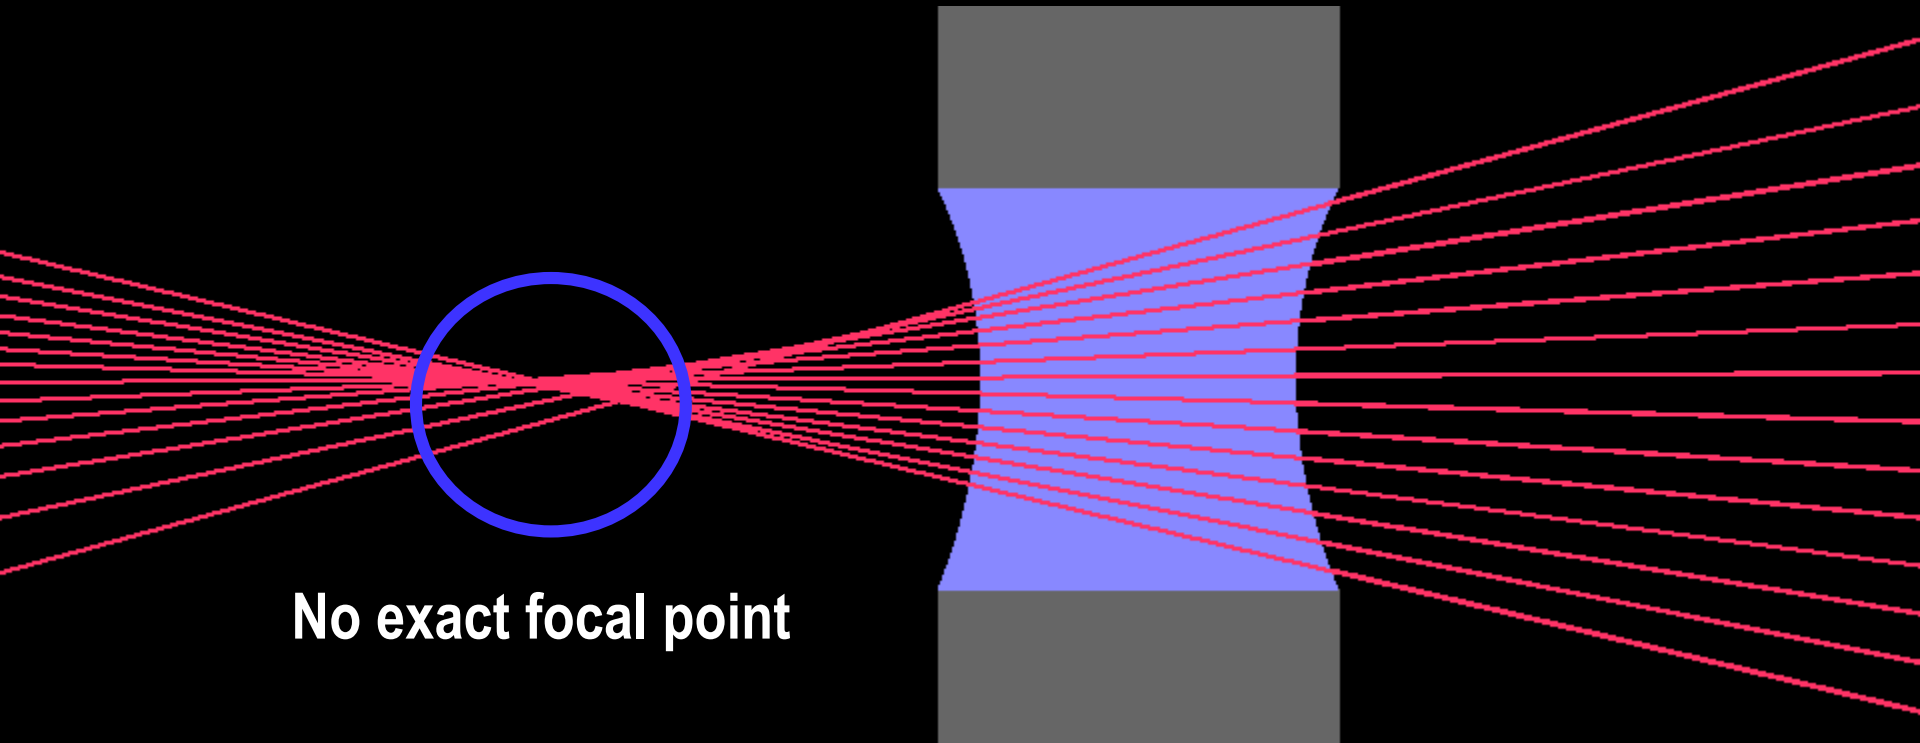

Meniscus may be...

- Thick
- Asymmetrical
- With small radius of curvature

# MENISCUS VS. LENS

- Can still sometimes behave like a lens
  - With some aberration, though

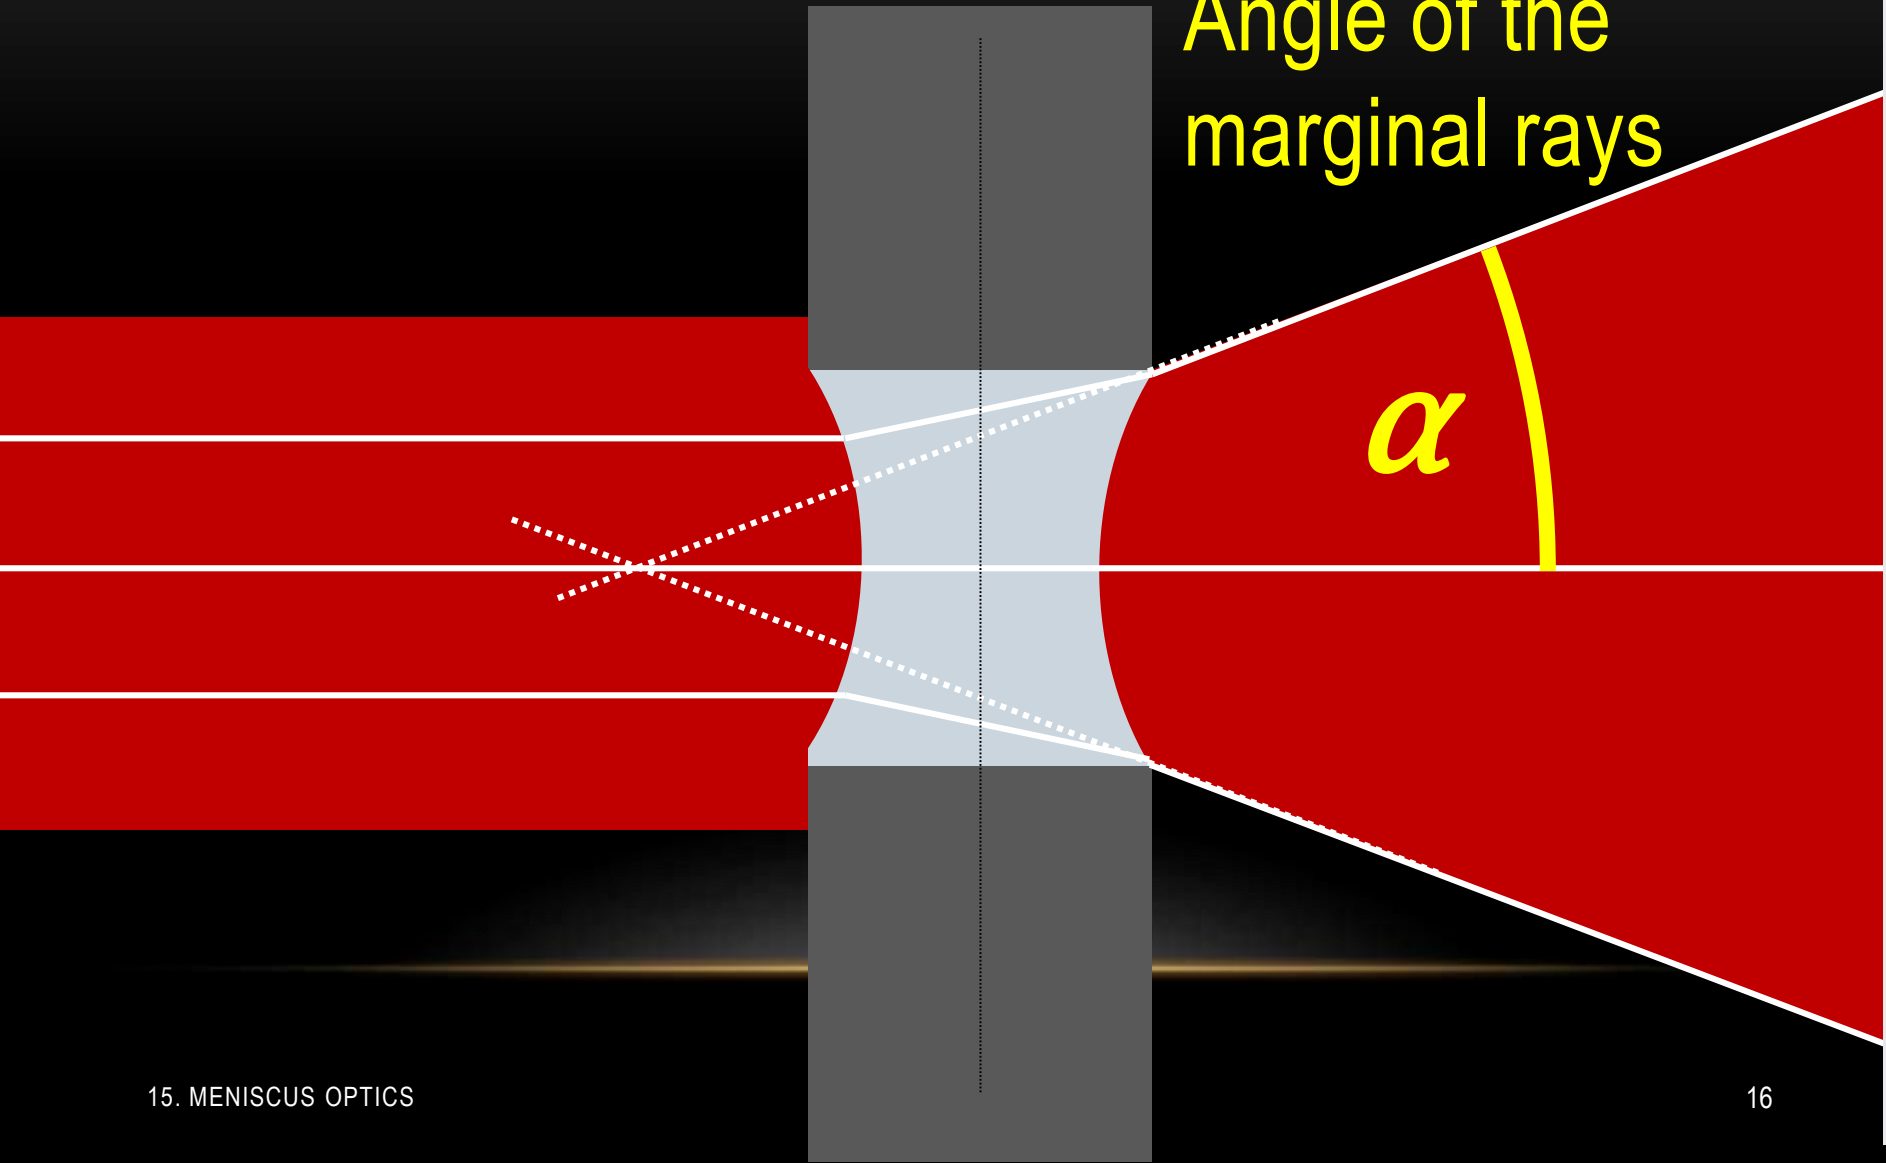

**No exact focal point**

Horizontal slit

# EXPERIMENTS

# RELEVANT QUANTITY TO MEASURE:

Angle of the  
marginal rays

# MEASUREMENTS

Set parameters  $t, w, d$

Measuring  $l$

Calculating  $\alpha$

$$\tan \alpha = \frac{\frac{l}{2} - \frac{w}{2}}{d - \frac{t}{2}}$$

$$\alpha = \arctan \left( \frac{l - w}{2d - t} \right)$$

# MEASUREMENTS

Liquid: soap water

# OUR SLITS

- 5 different thicknesses
- 5 different widths
- + Optical slit

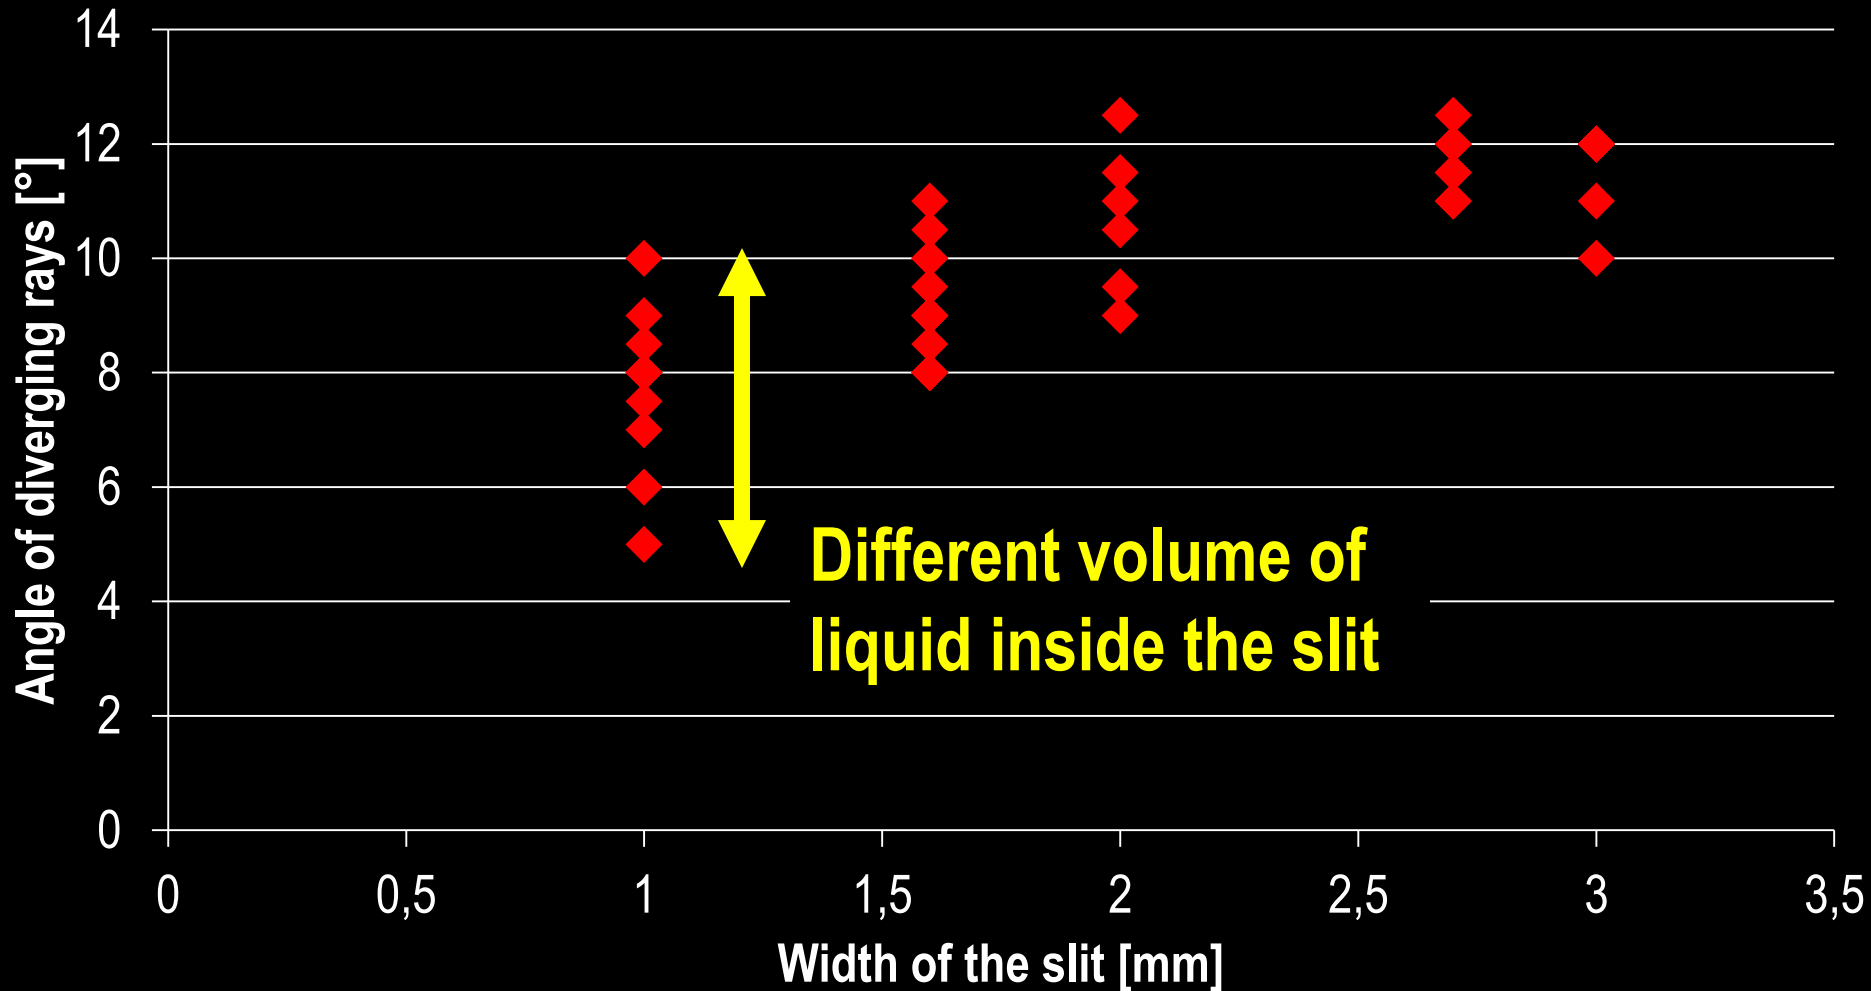

Width

CHANGING WIDTH

# CHANGING WIDTH

# CHANGING WIDTH OF THE SLIT

- **Very narrow slits** – hold relatively large amount of liquid
  - Low curvature  $\rightarrow$  low optical power

# CHANGING WIDTH OF THE SLIT

- **Wider slits** – liquid drains down, leaving thinner meniscus
  - Higher curvature  $\rightarrow$  more diverging

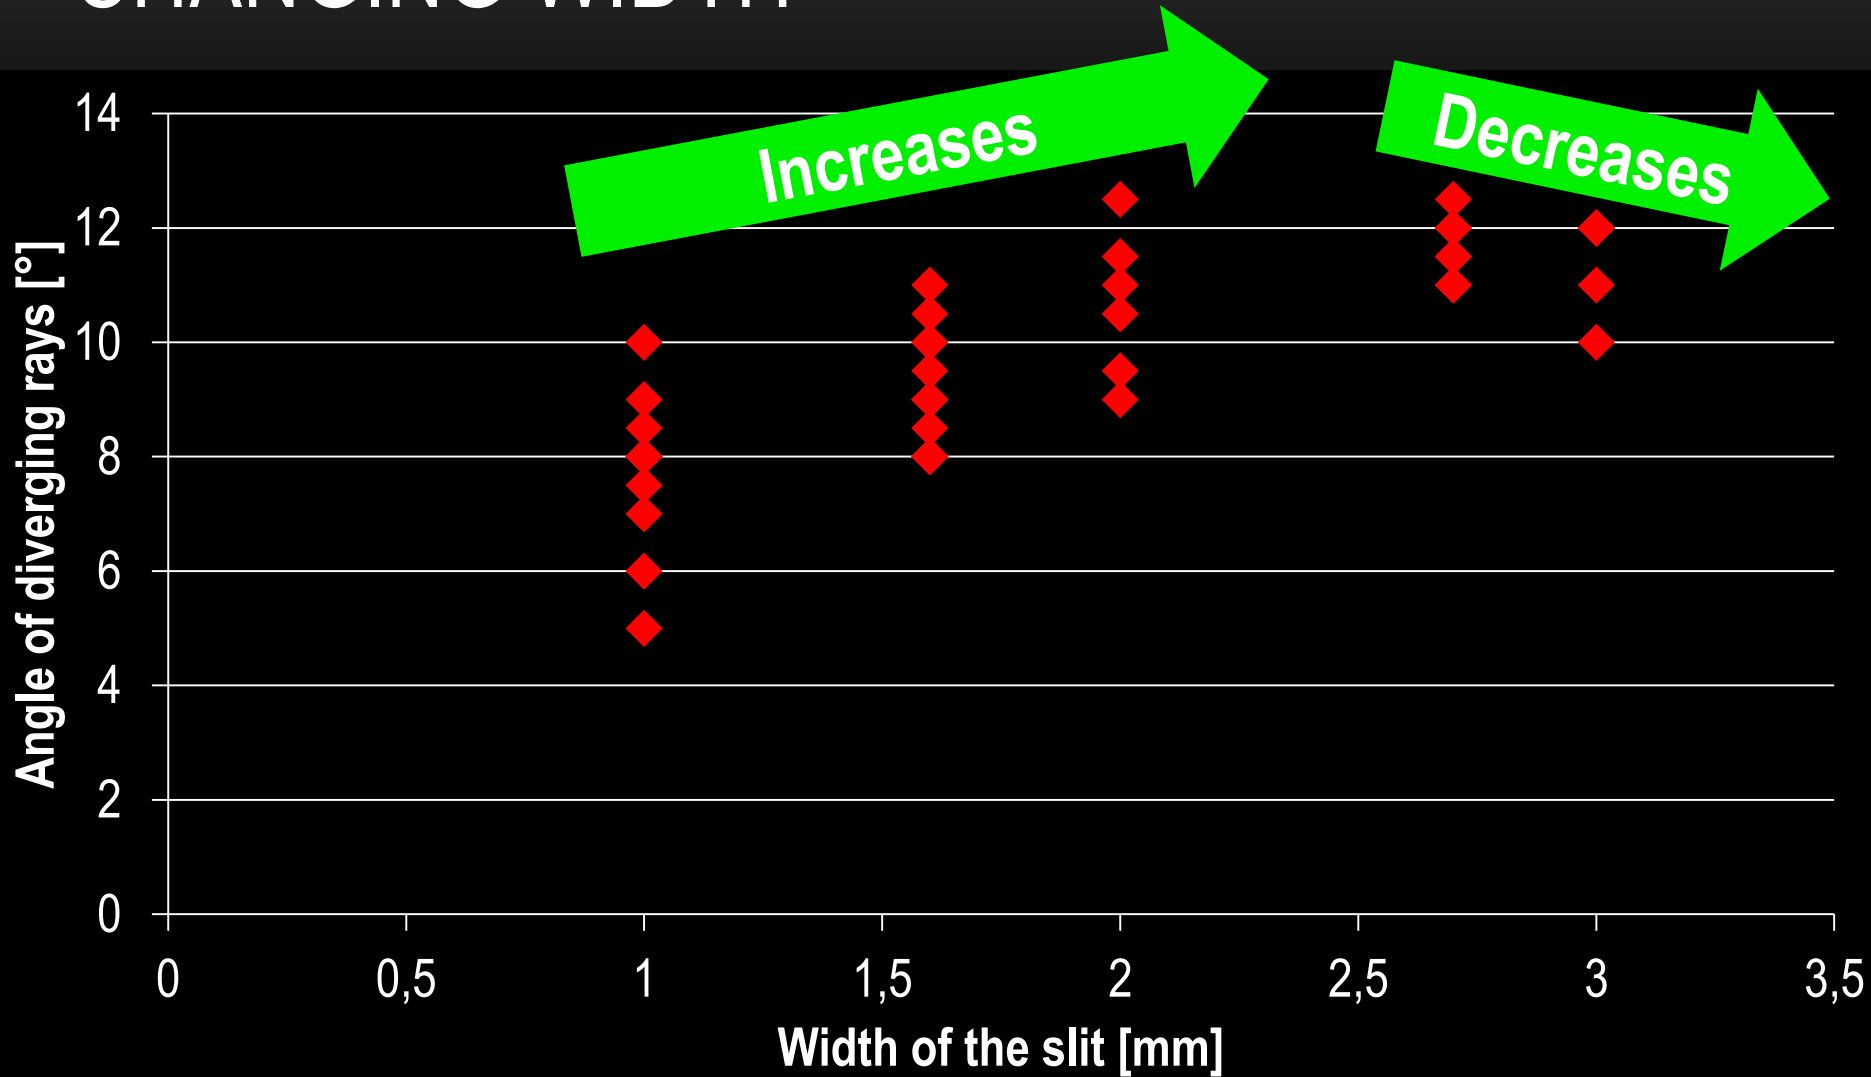

# CHANGING WIDTH OF THE SLIT

- **Too wide slits** – film must have non-zero thickness
  - Curvature is limited  $\rightarrow$  divergence falls again

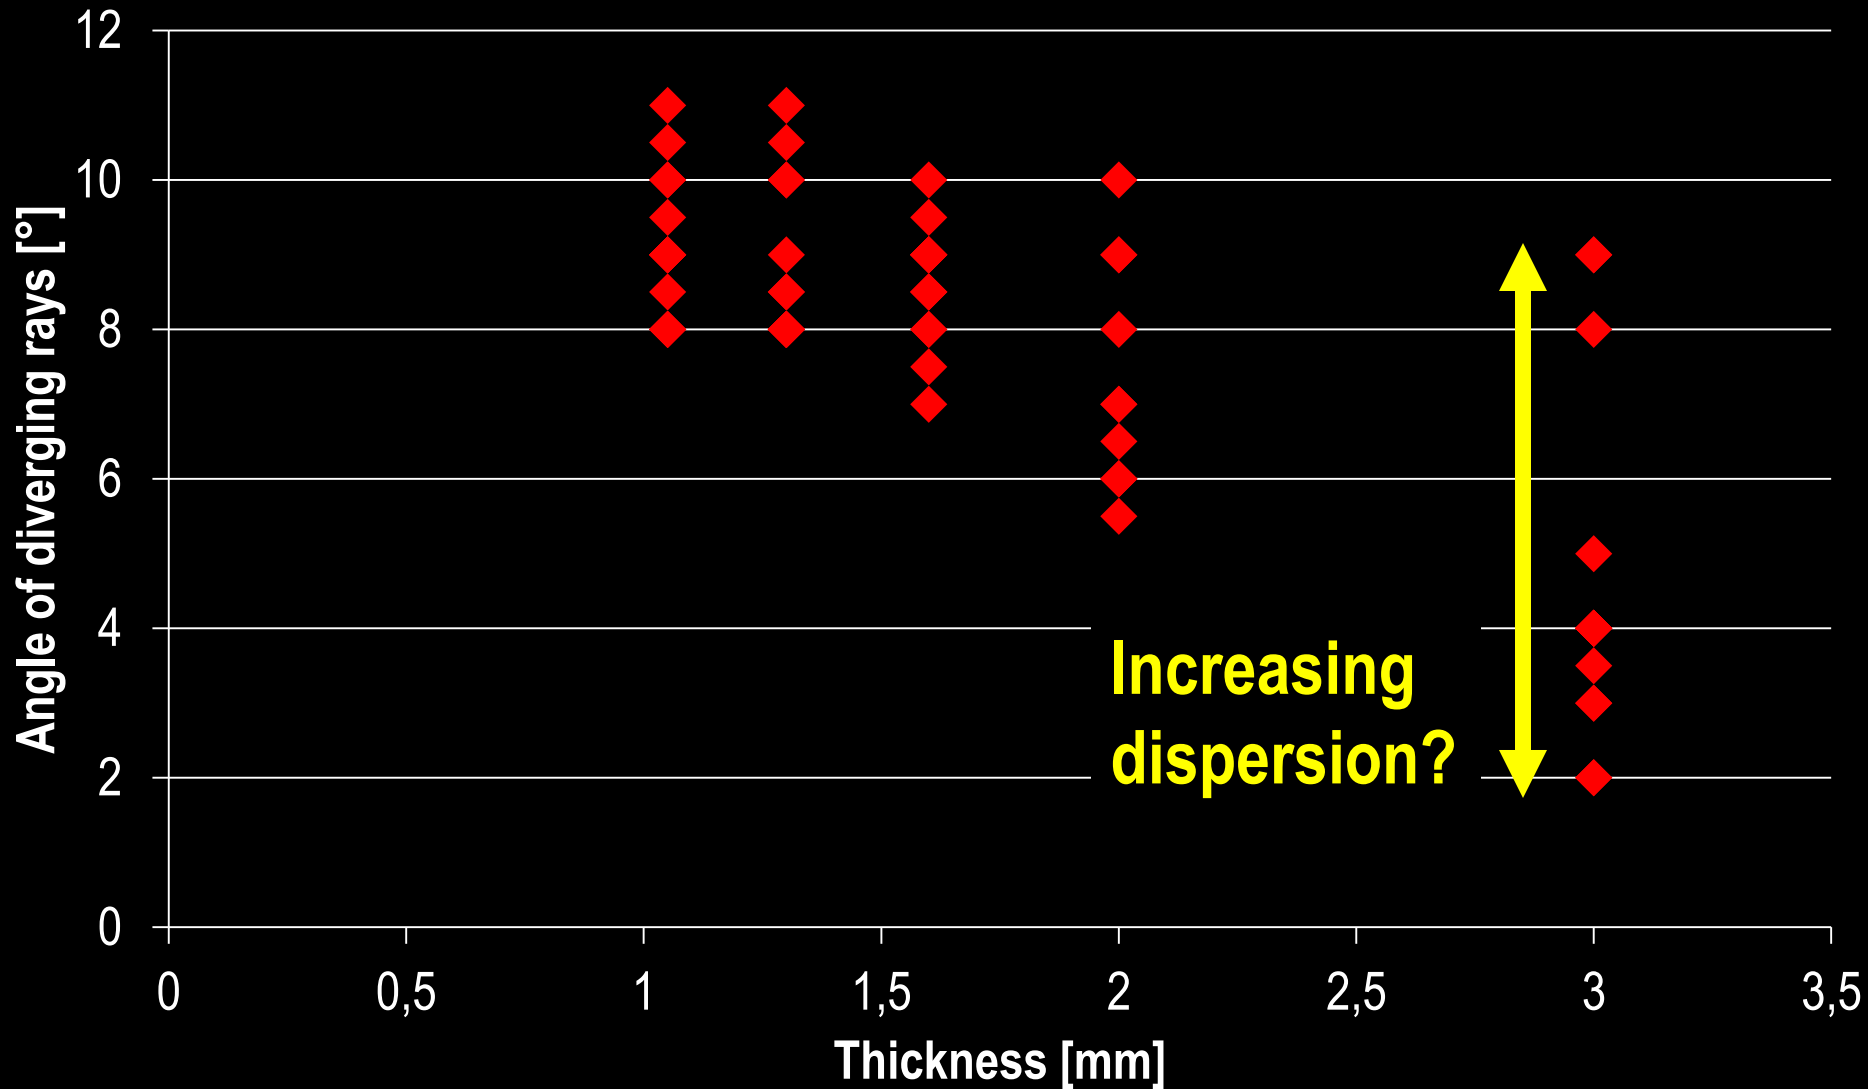

# CHANGING WIDTH

# CHANGING THICKNESS

# CHANGING THICKNESS

# LARGE DISPERSION

- The film doesn't always fill the entire slit
  - Film closer to the screen – more diverging
  - Film further from the screen – less diverging

# VERTICALLY PLACED SLIT

# LIQUID IN A VERTICAL SLIT

- No liquid at the top
  - Light passes trough
- The edge
  - Refracted/reflected away
- Lens-like shape
- Hydrostatic pressure
  - Less diverging at the bottom

# VERTICALLY PLACED SLIT PATTERN

# VERTICALLY PLACED SLIT – PATTERN

# DIFFRACTION AT THE EDGE – CLOSE-UP

Liquid wetting the slit

- effectively thinner slit at the edge
- wider diffraction maxima

Interesting phenomenon:

# BENDING OF THE PATTERN

# ROTATING THE SLIT

- Horizontal slit
- Turning around the vertical axis

Laser

Lenses

Slit

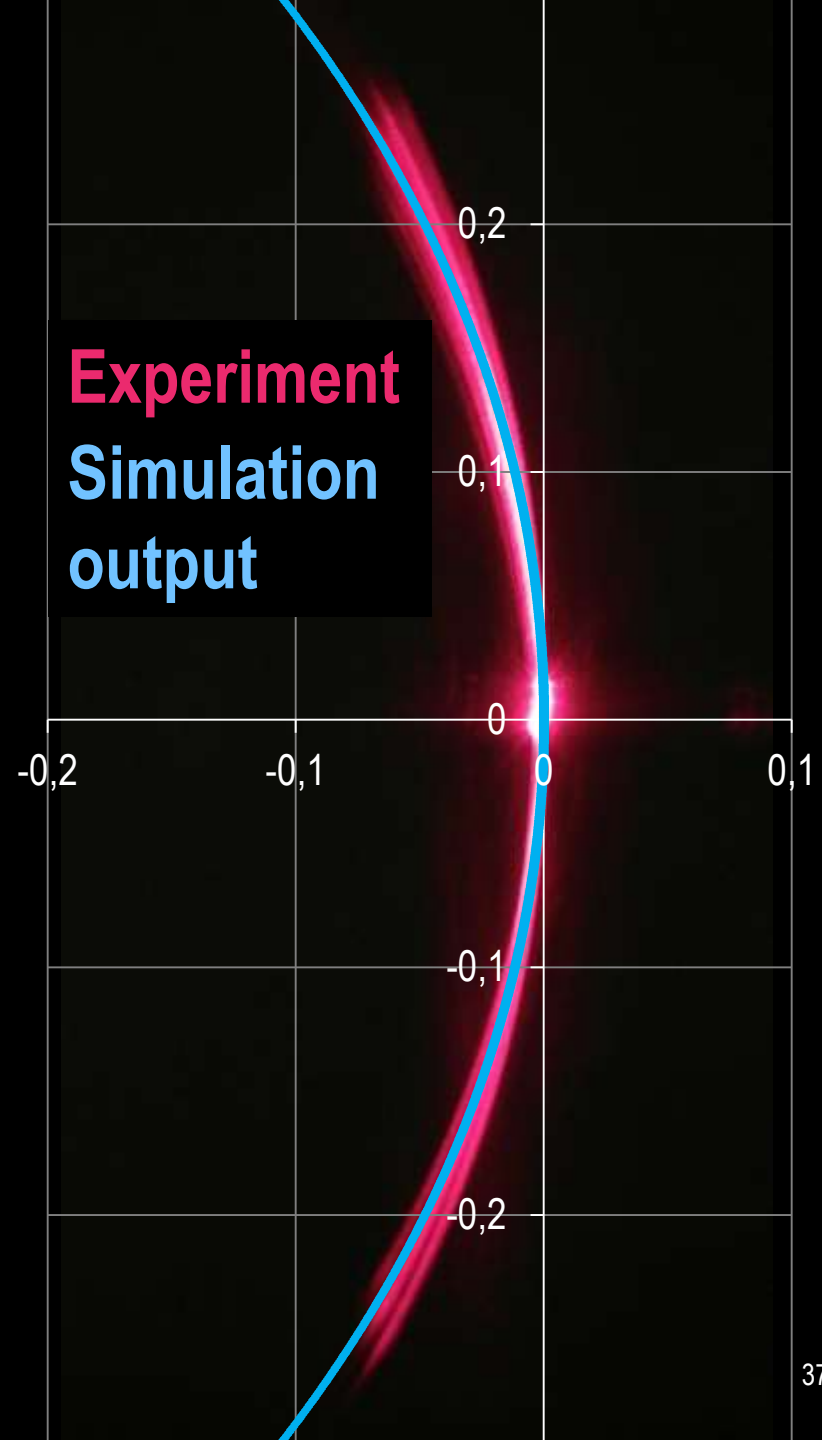

Screen

# INCREASING THE ANGLE

# BENDING PATTERN

- Picture – angle of tilt:  $54.5^\circ$
- Measuring:  
Curvature =  $1/\text{radius}$

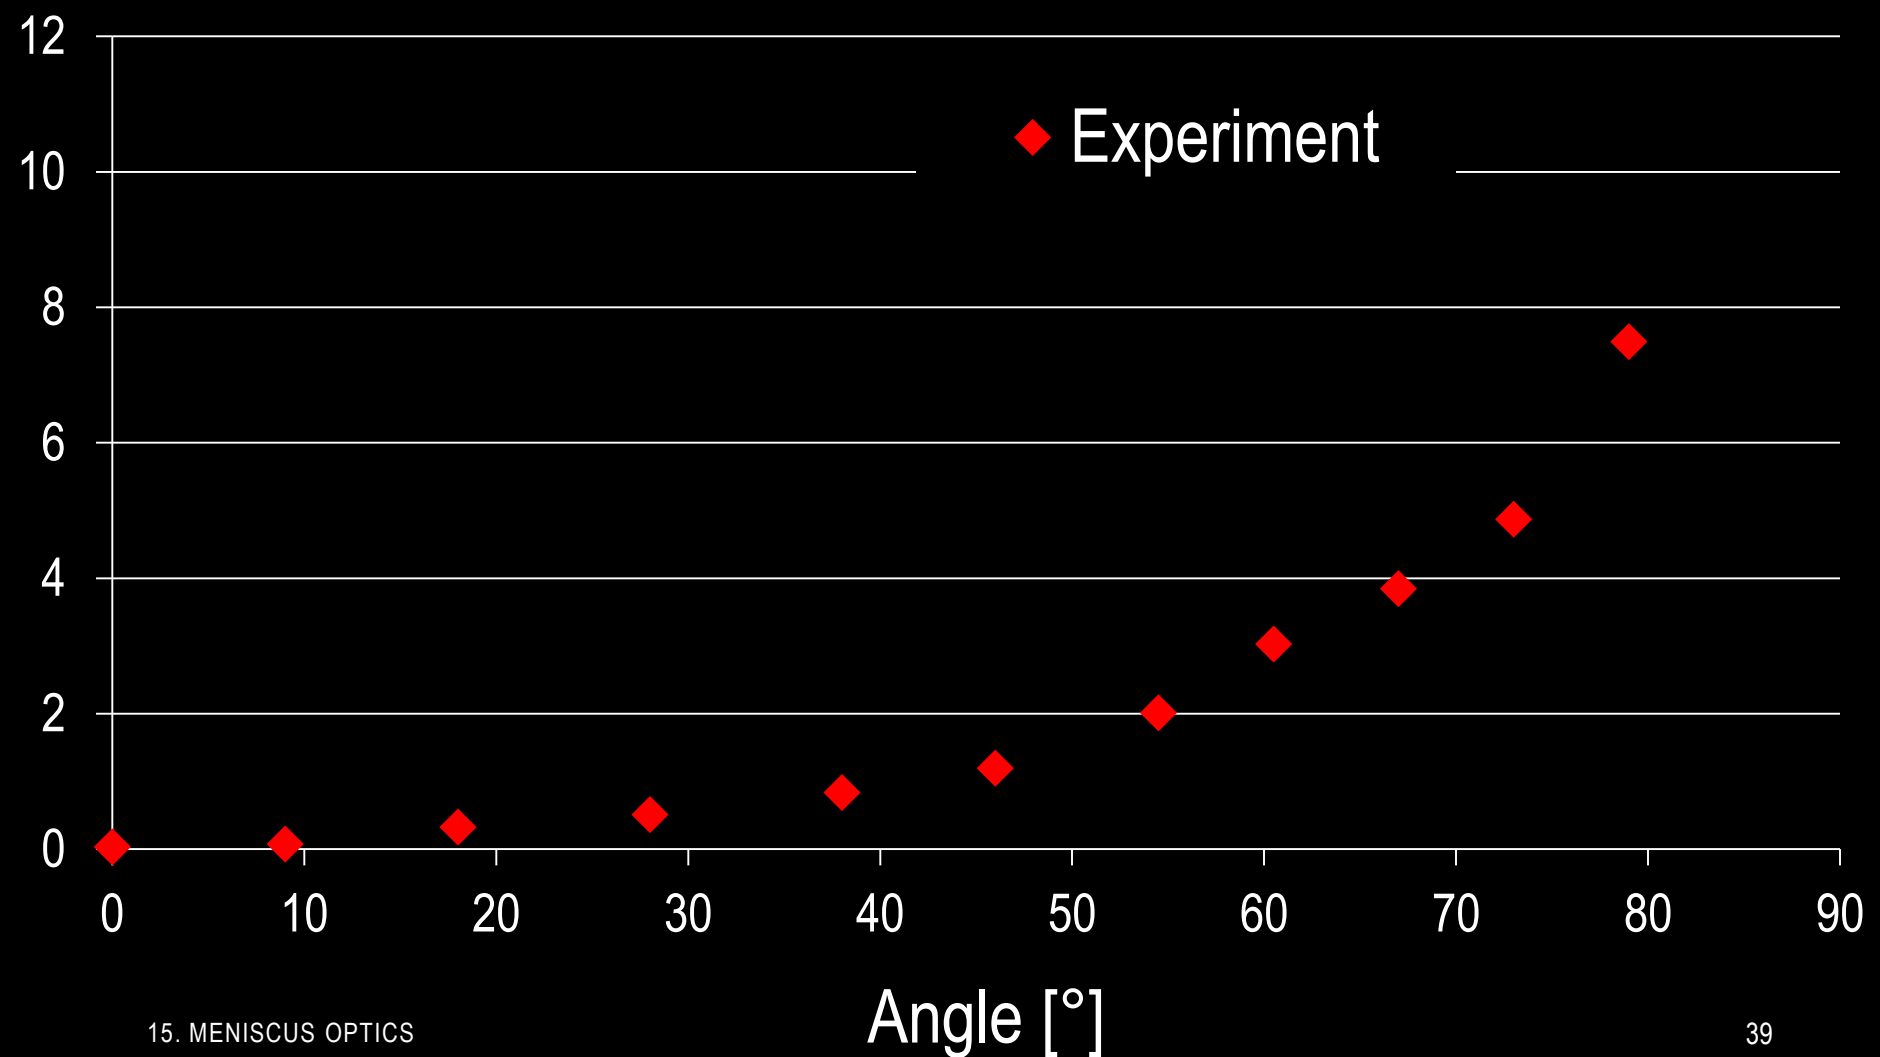

# CHANGING ANGLE

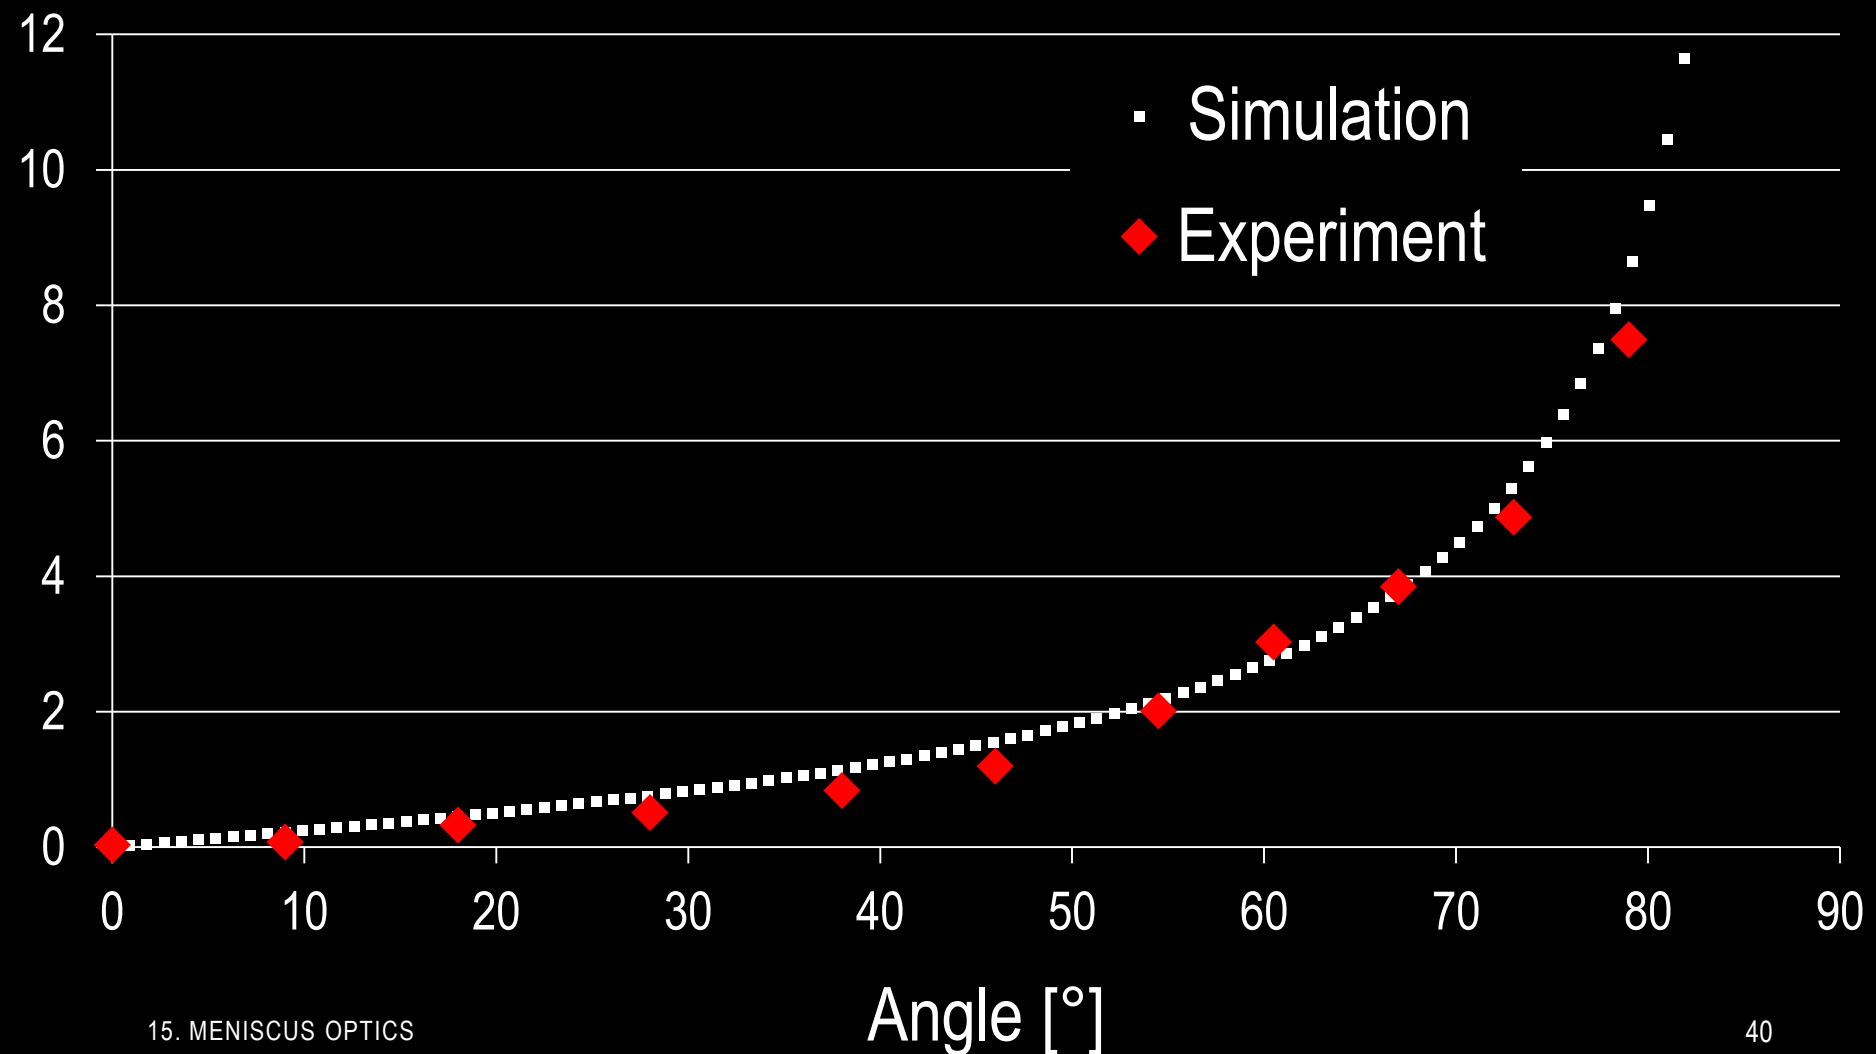

# CURVATURE DEPENDING ON ANGLE

Curvature =  $1/\text{radius}$  [ $\text{m}^{-1}$ ]

# CURVATURE DEPENDING ON ANGLE

Curvature =  $1/\text{radius}$  [ $\text{m}^{-1}$ ]

Interesting patterns

# THE ARTISTIC POINT OF VIEW

# SUMMARY

- Meniscus as a lens
  - Simulation used
- Horizontal slit pattern investigated
  - Dependence on width, thickness
- Vertical slit – pattern explained
- Bending of the pattern
  - Simulation
- Other interesting patterns

THANK YOU FOR YOUR ATTENTION

# APPENDICES

# SHAPE CALCULATION

- Euler's method; Delphi
- Increments of  $\frac{dz}{dy}(y)$  and  $z(y)$  based on radius of curvature
- Boundary conditions:
  - Width, thickness
  - Slope at the bottom

# SHAPE CALCULATION

Euler's method; Delphi

Forces equilibrium:  $\frac{1}{R(y)} = \frac{1}{\gamma} (\Delta p(0) + y\rho g)$

Second derivative  $z''(y) = \frac{1}{R(y)} (z'(y)^2 + 1)^{\frac{3}{2}}$

First derivative  $\Delta z'(y) = z''(y)\Delta y$

Increment  $\Delta z = z'(y)\Delta y + \frac{1}{2}z''(y)\Delta y^2$

# SHAPE CALCULATION

- Boundary conditions:
  - Width, thickness
  - Slope at the bottom
  - Symmetrical shape (with respect to  $y$ -axis)

# SLITS OVERVIEW

- Changing width, thickness = 1.0mm
  - 1.0mm, 2.0mm, 1.6mm, 2.7mm, 3.0mm
- Changing thickness, width = 1.6mm
  - 1.0mm, 1.3mm, 1.6mm, 2.0mm, 3.0mm
- Optical slit
  - Width 0.5mm, thickness 1.0mm

# AIRY DISC

- Circular aperture
- Diffraction of light

# BUBBLES AND IMPURITIES

- Move, slowly float within the liquid

# CHANGING ANGLE

# SLIT TOO WIDE

- Liquid either drains away, or forms a thin film
  - Low curvature  $\rightarrow$  no special pattern created

# DIFFERENT LIQUIDS

- Most drain down from the slit too quickly
- Some don't let enough light through (honey)

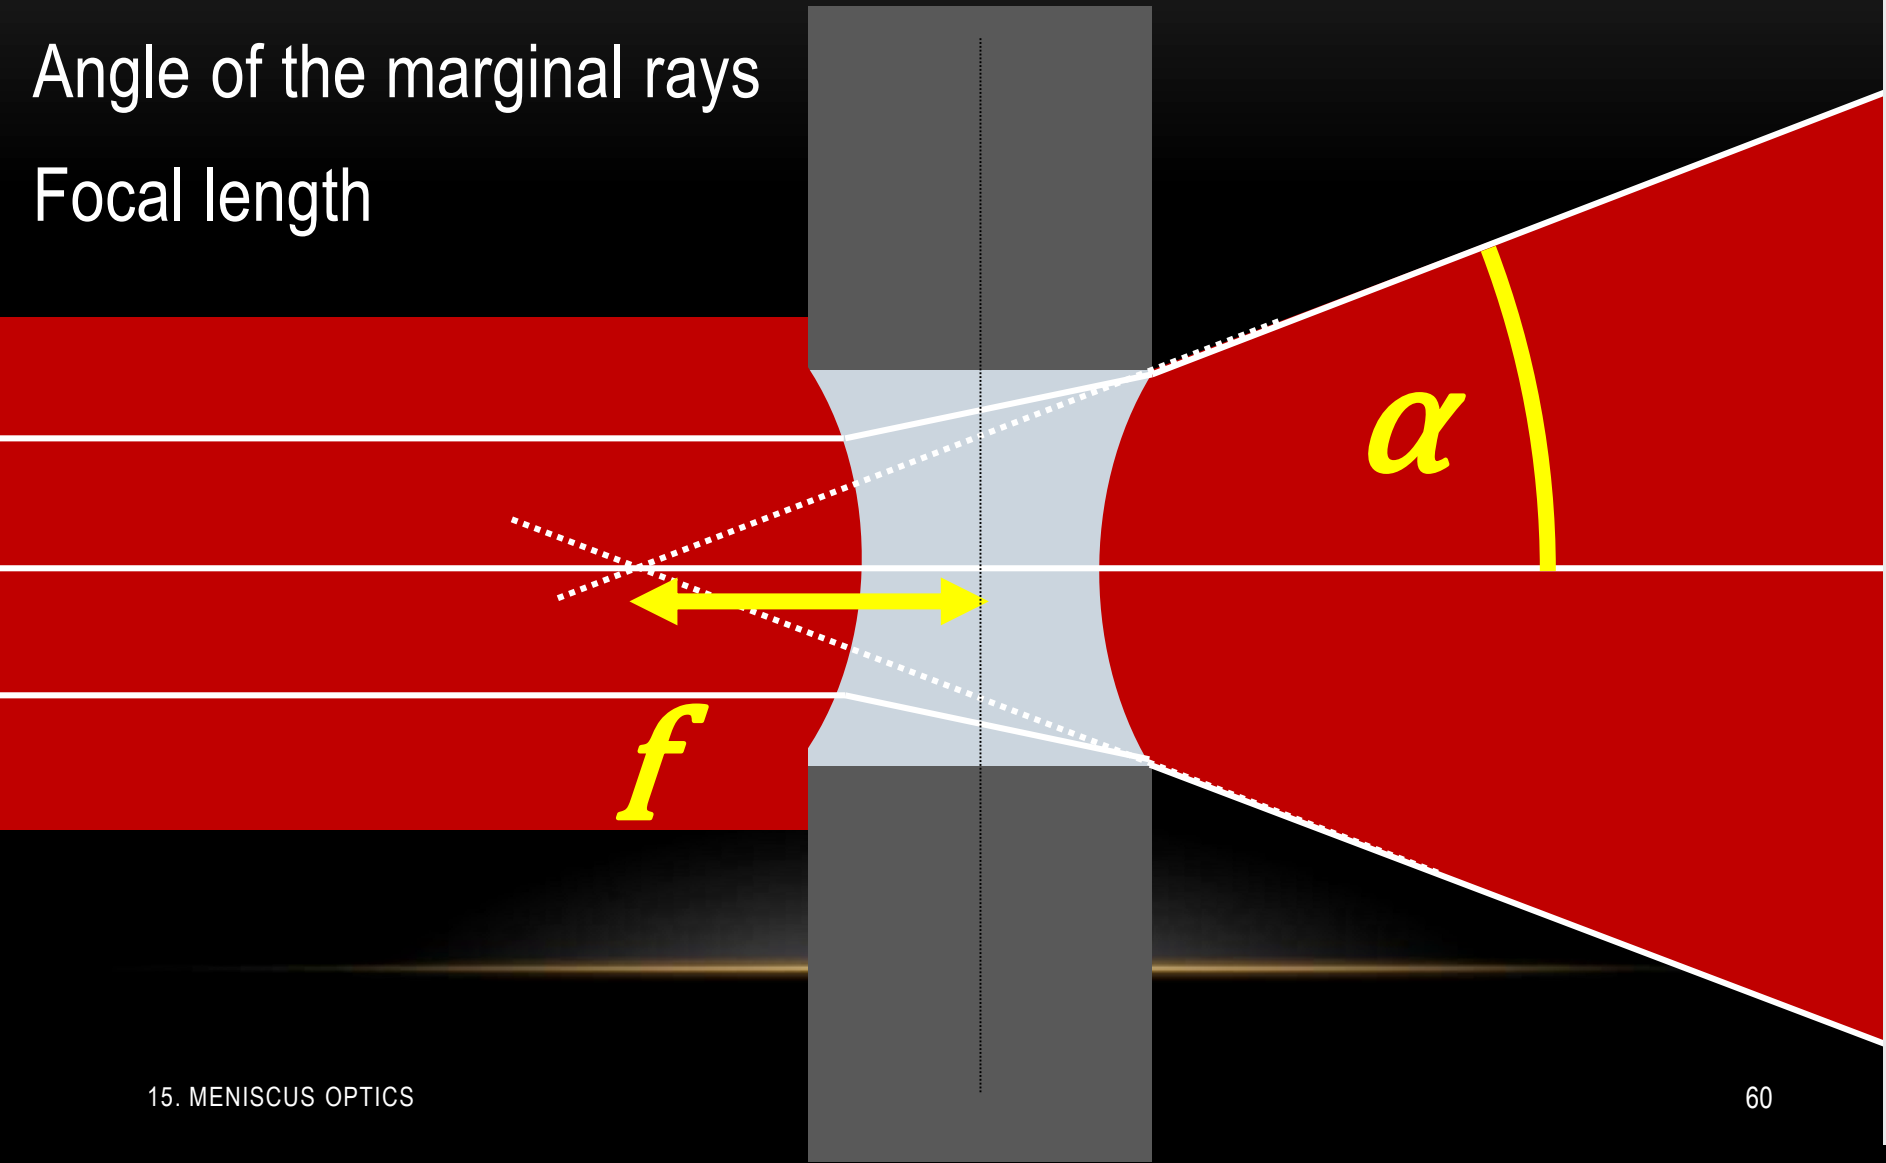

# NEVYMAZANE

# RELEVANT QUANTITIES TO MEASURE

Angle of the marginal rays

Focal length

# MEASUREMENTS

Set parameters  $t, w, d$

Measuring  $l$

Calculating  $\alpha, f$

$$\alpha = \arctan \left( \frac{l - w}{2d - t} \right)$$

$$f = \frac{w}{\tan \alpha} - \frac{t}{2}$$

$$\tan \alpha = \frac{\frac{l}{2} - \frac{w}{2}}{d - \frac{t}{2}} = \frac{w}{f + \frac{t}{2}}$$

# IS IT THE WATER, OR THE SHAPE?

AQUARIUM full of water

SOAP FILM
