

Problem №15 Mountain Peaks

Team of Belarus

Reporter: Sofia Anisimova

Problem

- What methods are used to determine the elevation of the World's highest mountains? Suggest your own experimental method and determine the height of a mountain or of a hill of your choice.

Modern methods

- GPS
- Barometric leveling
- Triangulation
- Radiolocation

Height of mountain

The relative height

The altitude

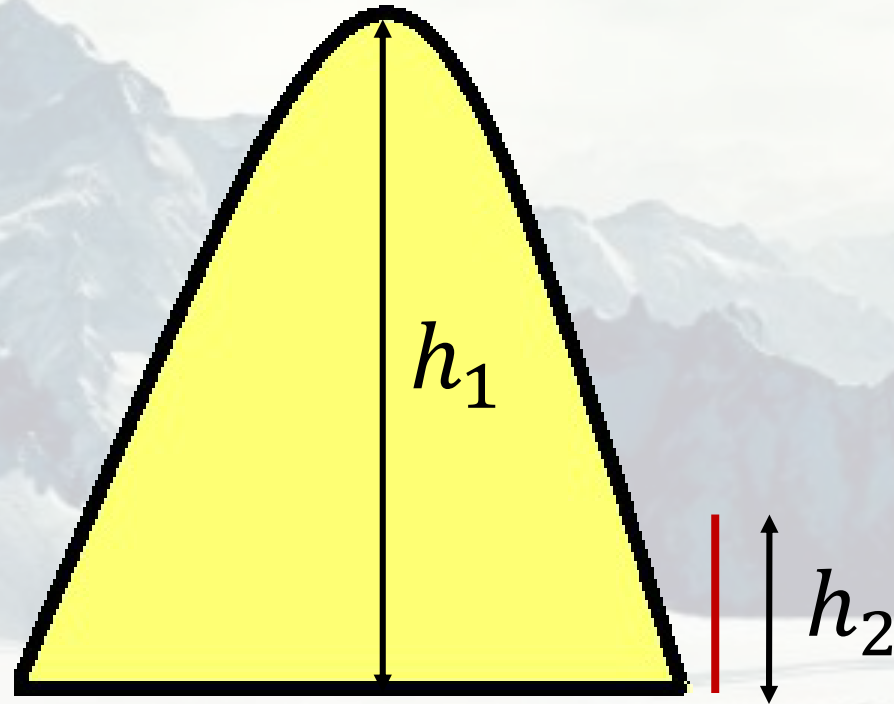

Methods

- Photogrammetry
- Optical leveling

Photogrammetry

$$\frac{h_1}{h_2} = \frac{h'_1}{h'_2}$$

#1 Photogrammetry

#2 Optical leveling

#3 Top secret

#1 Photogrammetry

#2 Optical leveling

#3 Top secret

The using of photogrammetry

#1 Photogrammetry

#2 Optical leveling

#3 Top secret

Resolving disadvantages

- Standard and mountain have different scale
- Aberration

#1 Photogrammetry

#2 Optical leveling

#3 Top secret

Ideal
model

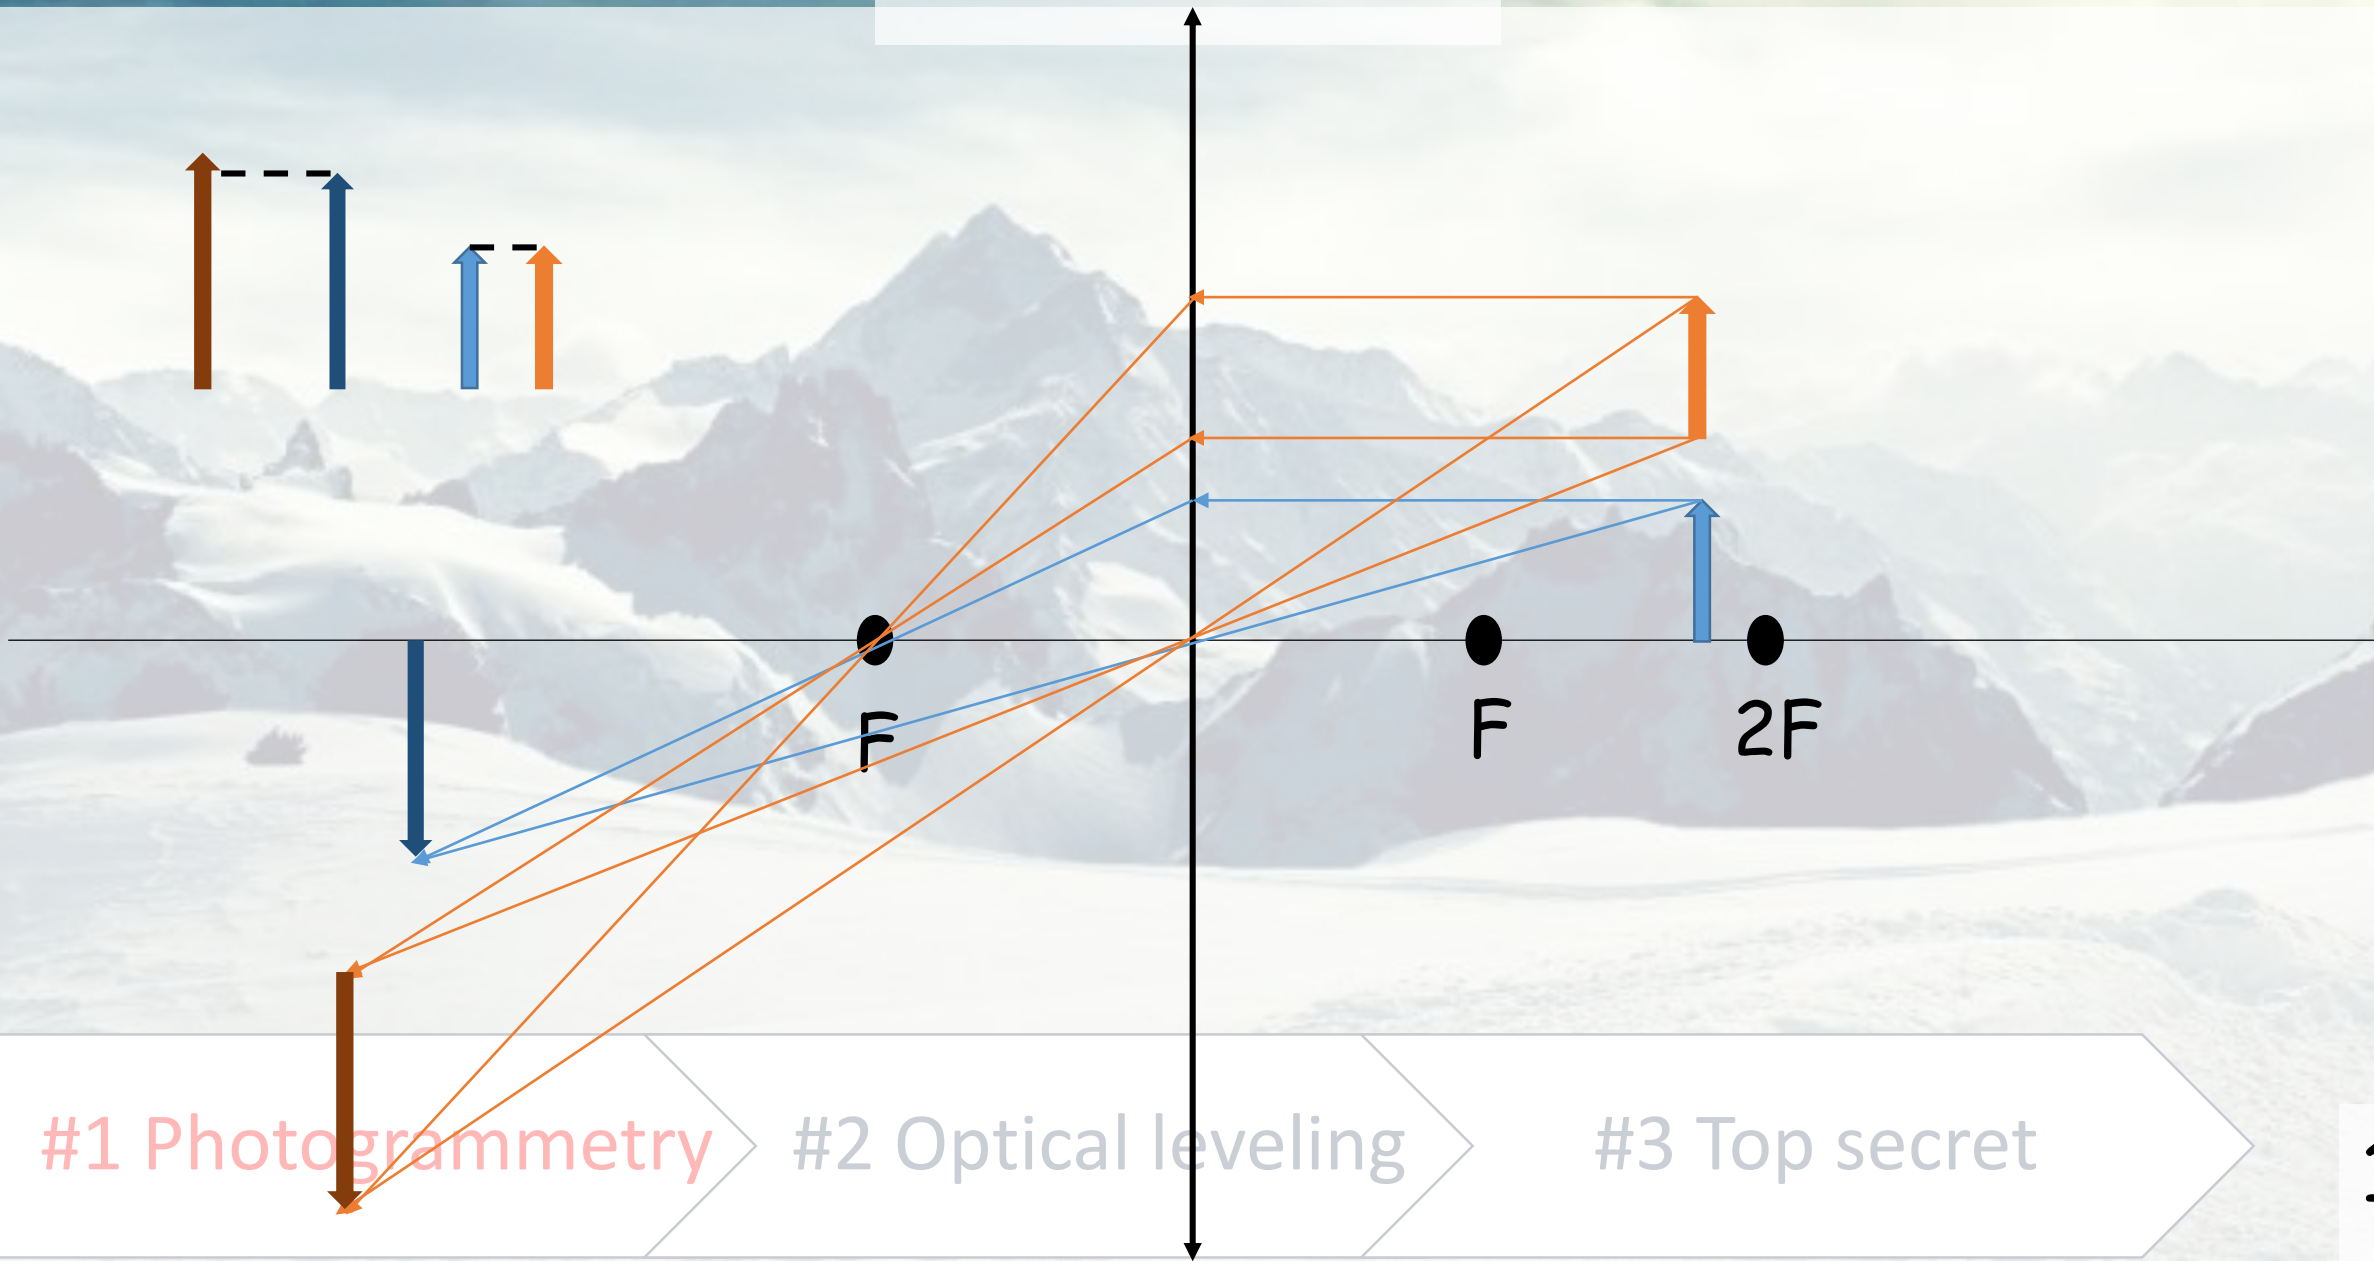

Our result: 8,1 m
Passport data: 8

#1 Photogrammetry

#2 Optical leveling

#3 Top secret

Aberration

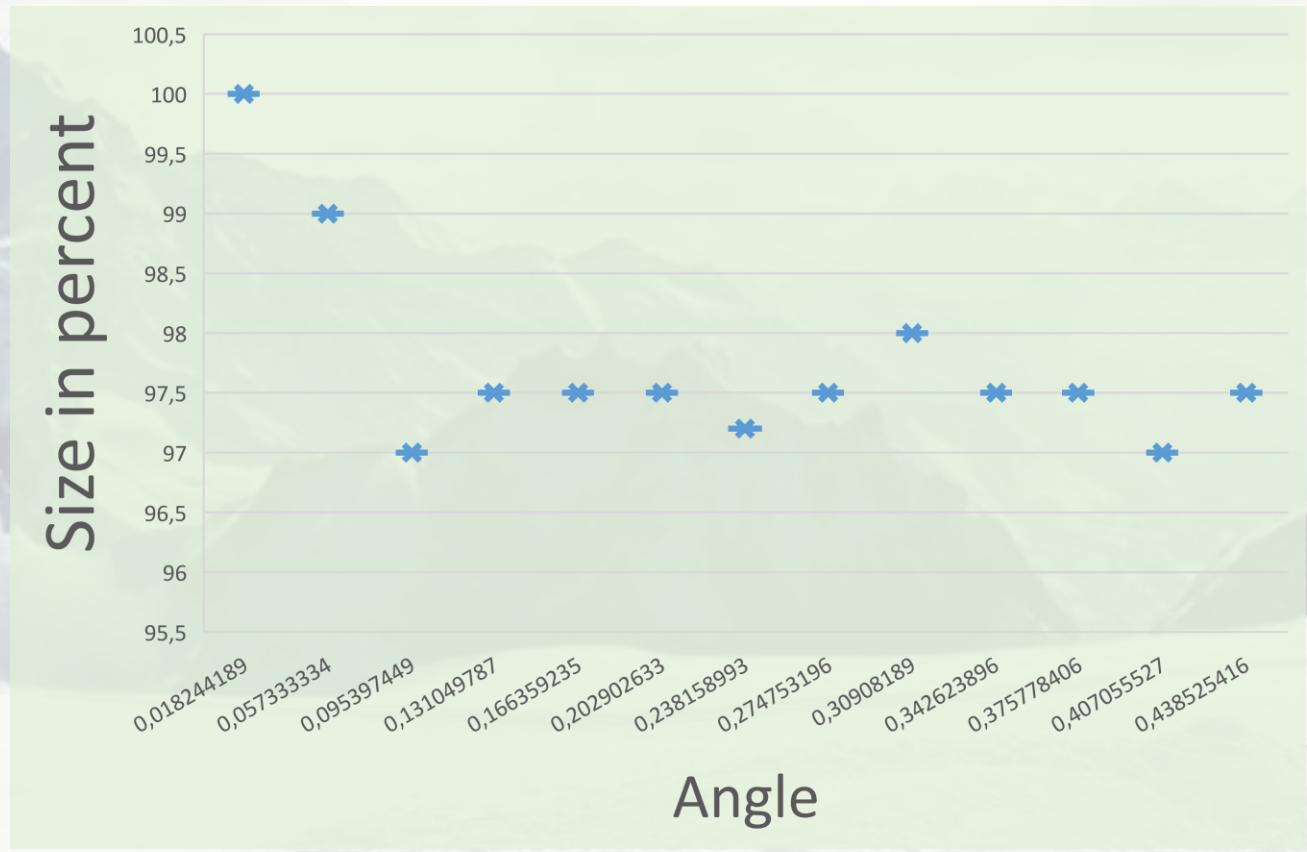

#1 Photogrammetry

#2 Optical leveling

#3 Top secret

Aberration

#1 Photogrammetry

#2 Optical leveling

#3 Top secret

Advantages

- Understandable
- Simple set-up

Disadvantages

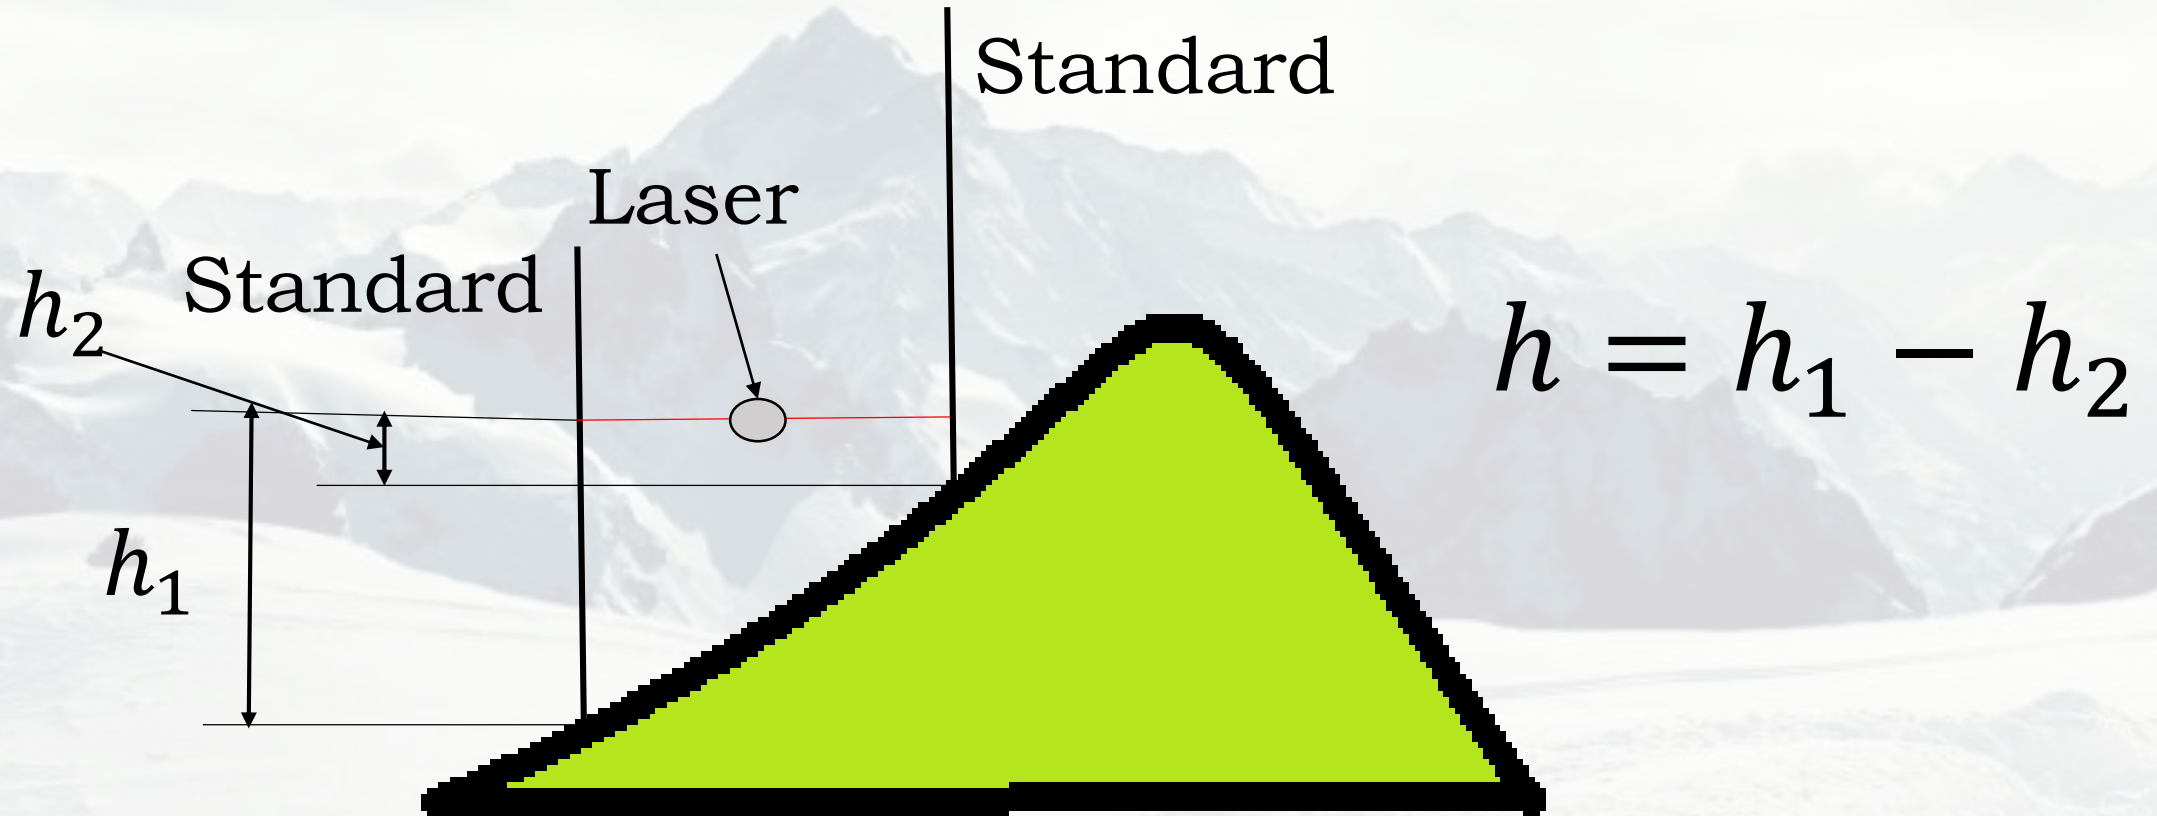

- Computer is required
- Lots of separate steps
- Aberration

#1 Photogrammetry

Experiments

#1 Photogrammetry

#2 Optical leveling

#3 Top secret

Results

	Optical	Photogrammetry
Building	18 steps H = 8,1 e = 9%	1 step 8,14 e = 6%
Hill	26 steps 14,4 e = 1,5%	3 steps 14,37 e = 4%
Car	Not available	1 step 1,91 e = 4%

A high-altitude mountain landscape with snow-covered peaks and a cloudy sky. The foreground shows a snow-covered slope with some tracks. The background features jagged mountain peaks under a bright, overcast sky.

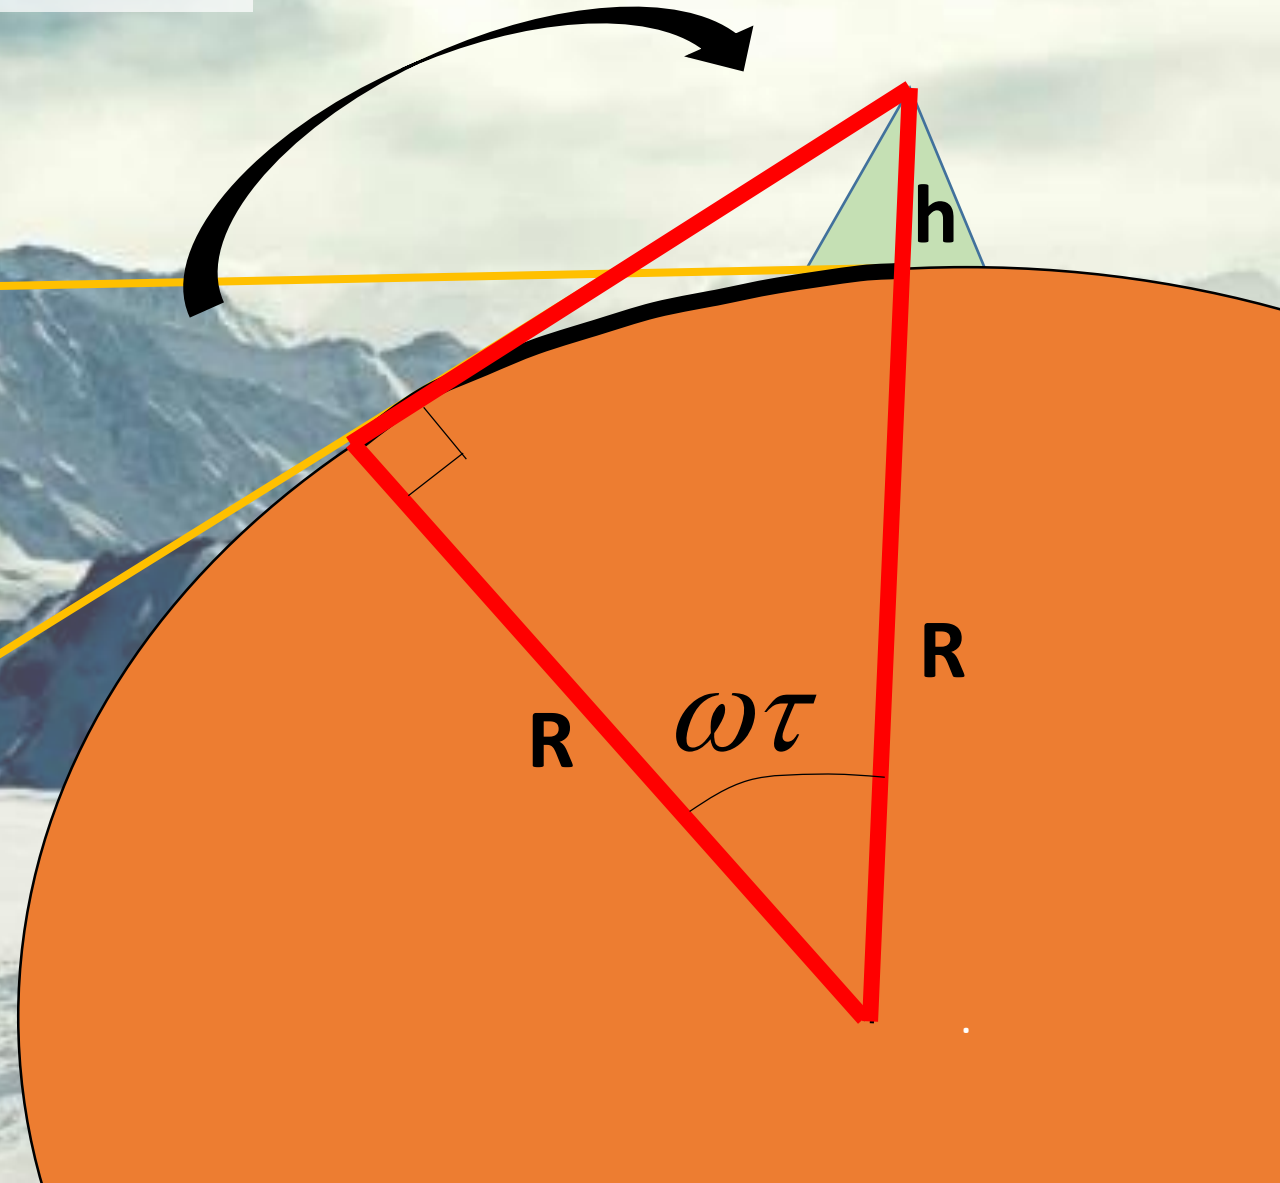

The second part- the altitude

(Top secret)

Sunset

$$(R + h) * \cos(\omega\tau) = R$$

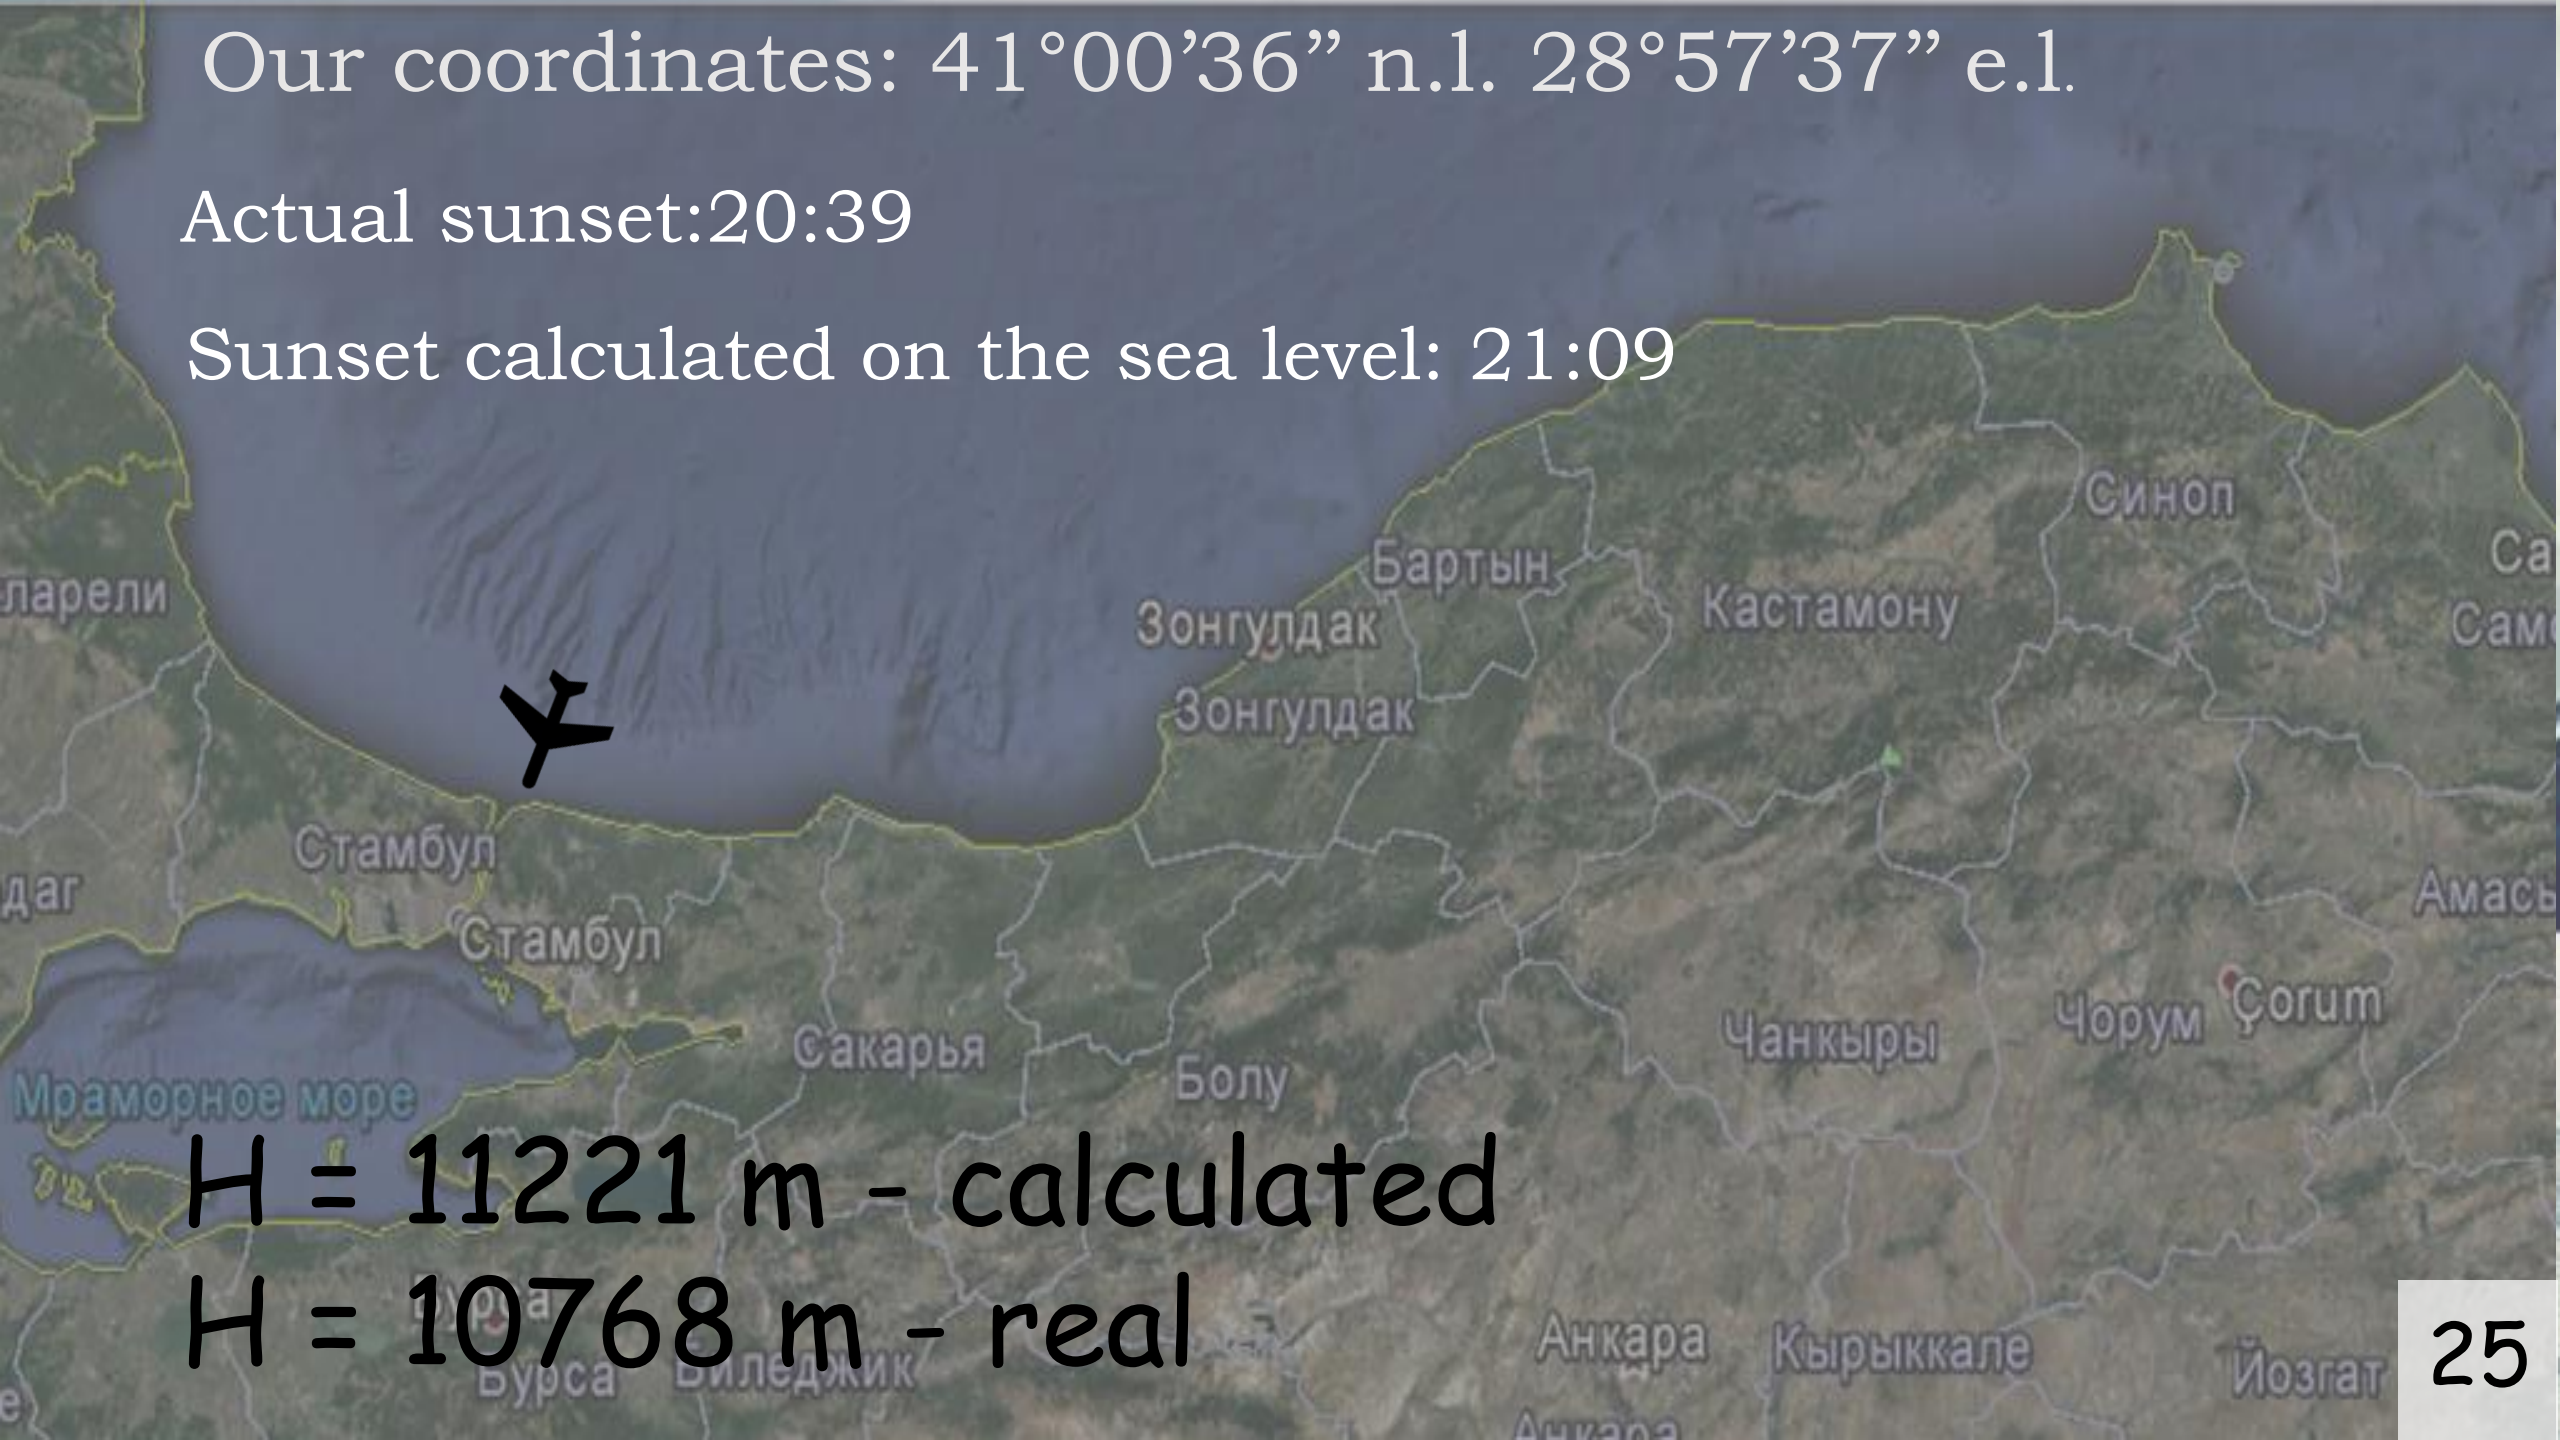

$$h = (R / \cos(\omega\tau)) - R$$

Our coordinates: $41^{\circ}00'36''$ n.l. $28^{\circ}57'37''$ e.l.

Actual sunset: 20:39

Sunset calculated on the sea level: 21:09

$H = 11221$ m - calculated

$H = 10768$ m - real

Conclusions

- Two methods of height measurement are investigated and improved.
- Our own method proposed and confirmed.
- Photogrammetry isn't very effective method for determining hill.
- Methods used for measurements of hills in Belarus differ from the ones for the highest mountain peaks.
- Optic levelling appears to be the most precise method in Belarus

A scenic view of a snow-covered mountain range under a cloudy sky. The foreground shows a snow-covered slope with some tracks. The middle ground features several jagged, snow-capped peaks. The background shows more distant, hazy mountain ranges. The overall color palette is cool, with blues, greys, and whites.

Thank you
for attention!

Disadvantage of this method

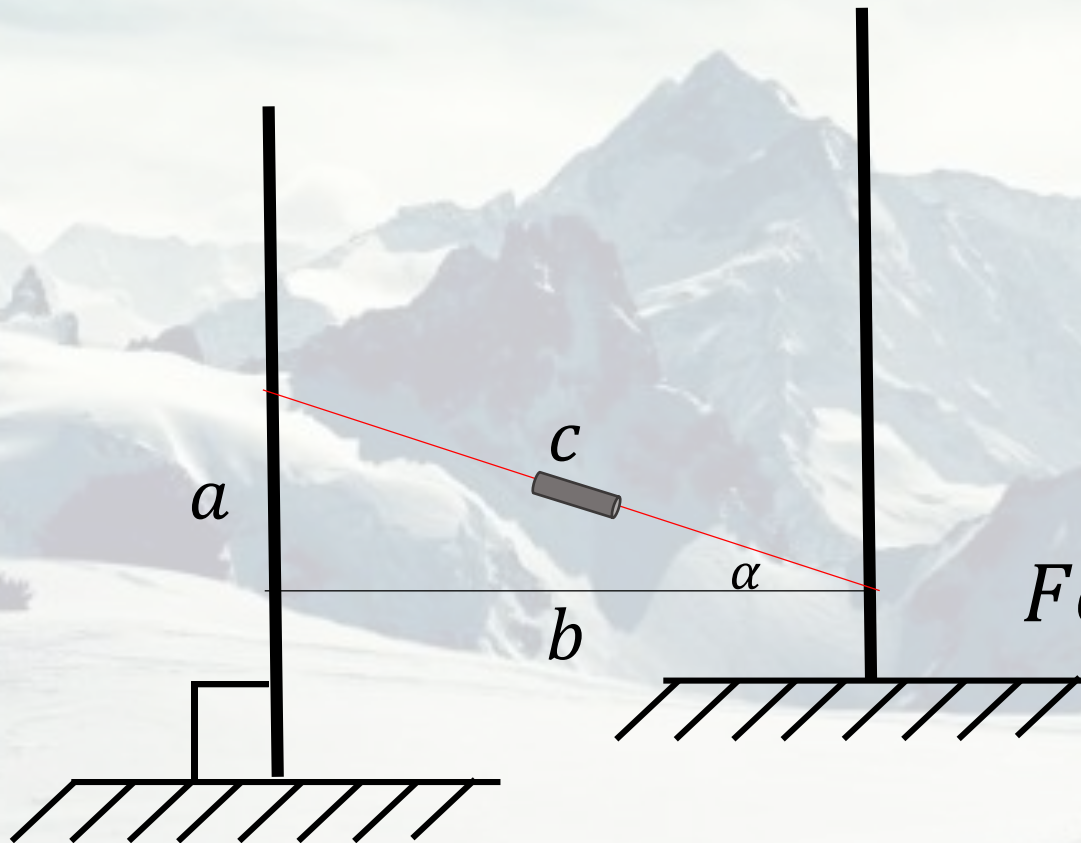

- Low accuracy of angle between ground and lasers measurement

#1 Photogrammetry

#2 Optical leveling

#3 Barometric
leveling

Angle dispersion

$$a = b \tan \alpha$$

$$Fault_1 = \frac{b \tan \alpha}{2}$$

$$Fault = 2 \frac{b \tan \alpha}{2} = b \tan \alpha$$

#1 Photogrammetry

#2 Optical leveling

#3 Barometric leveling

Two lasers

Our set-up for
determining elevation

Our set-up for
dispersion determining

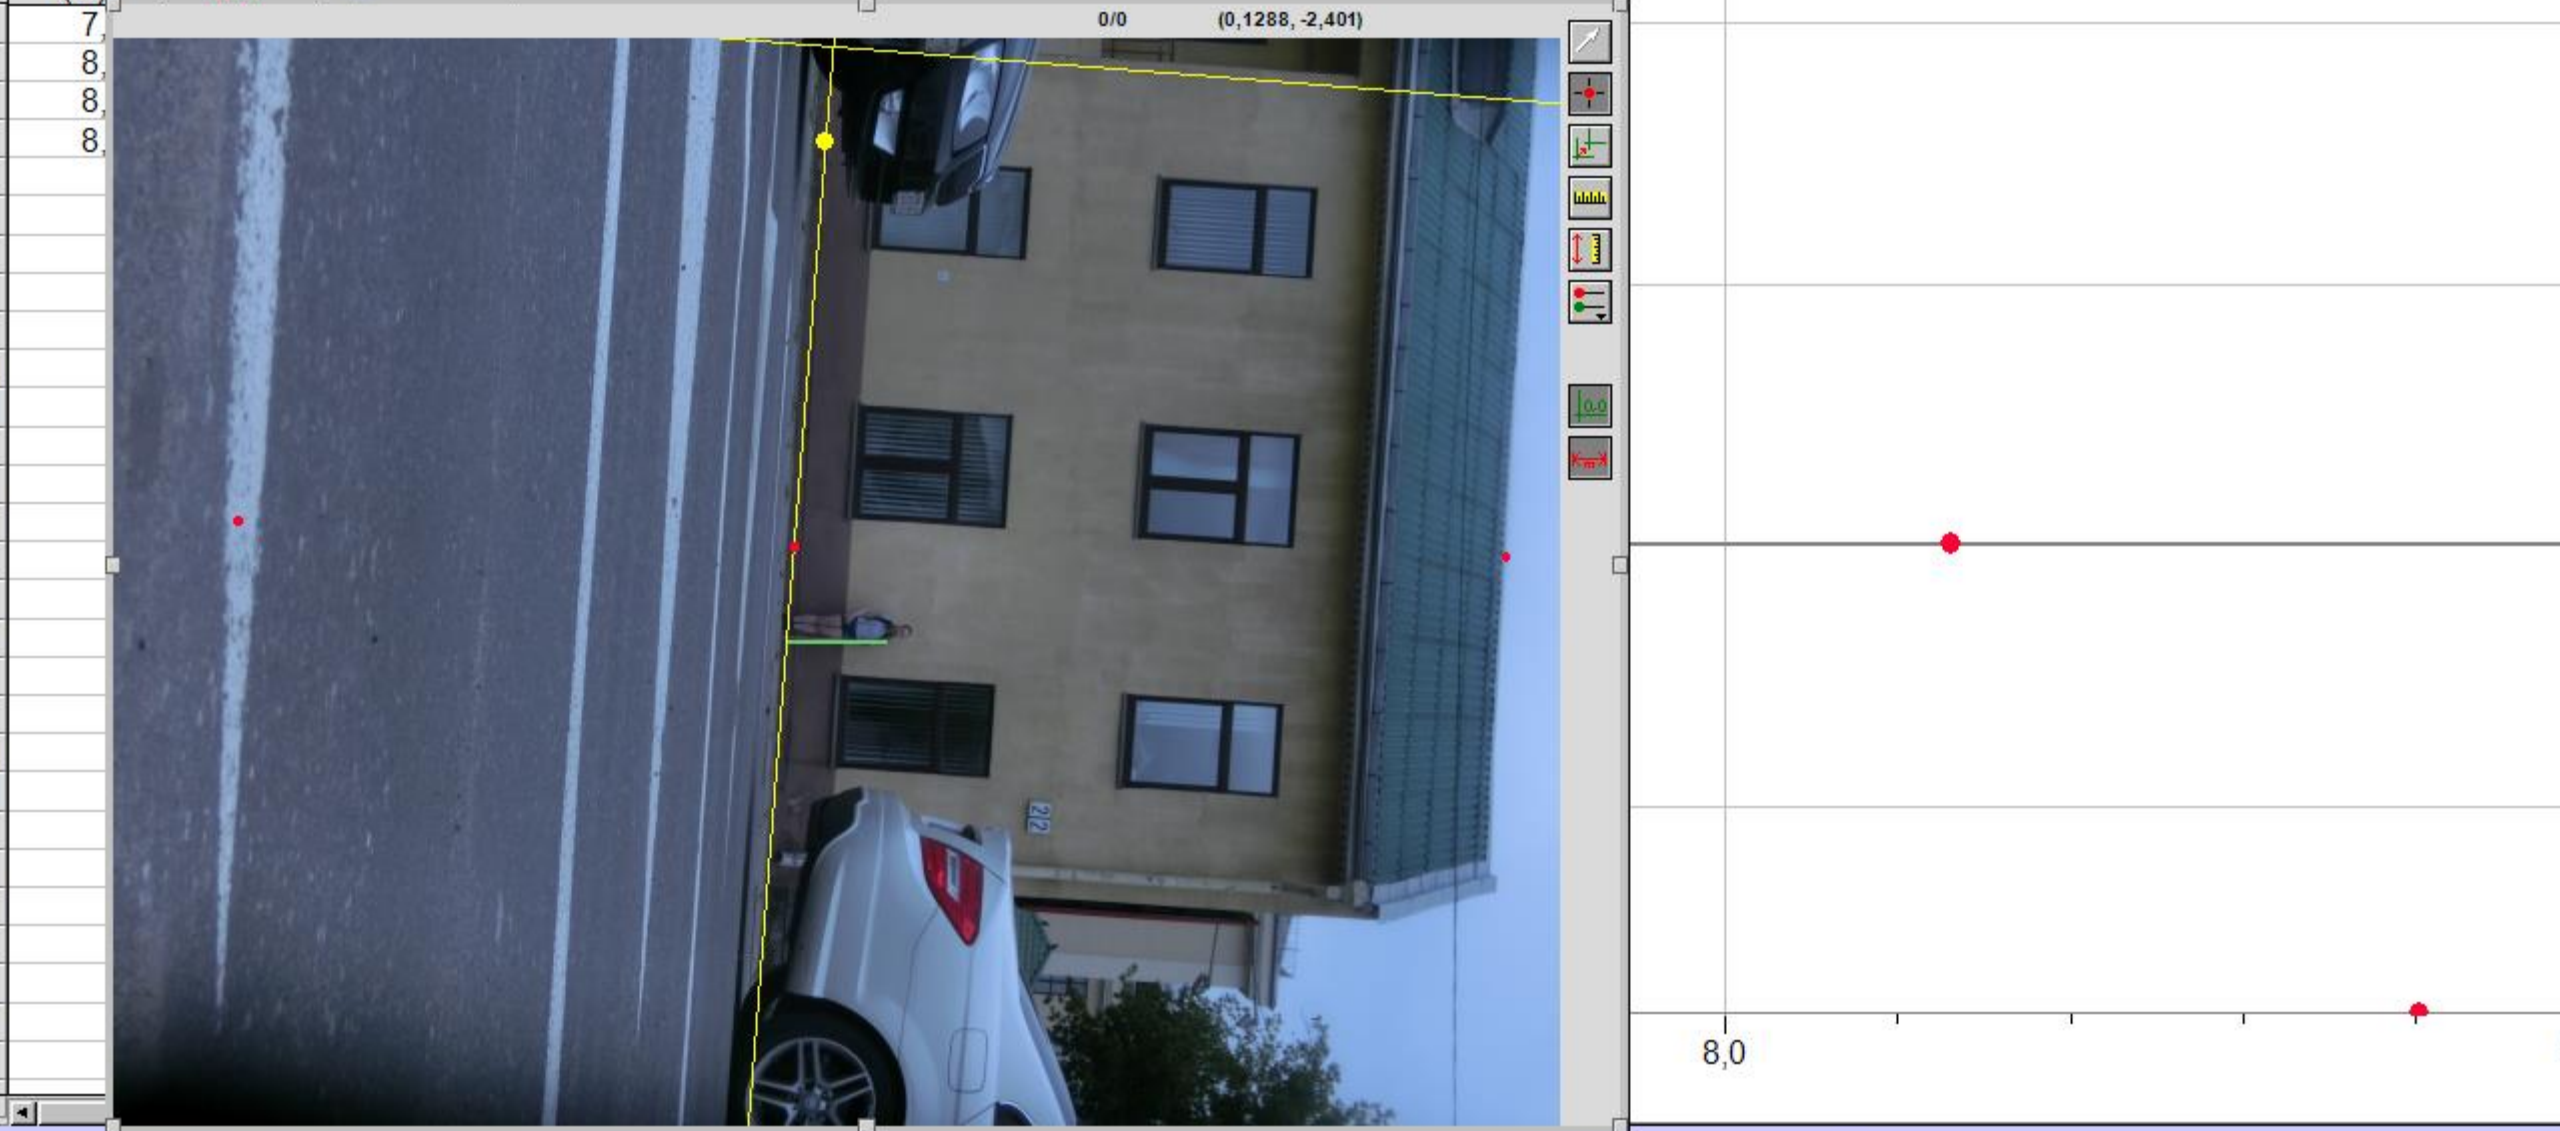

#1 Photogrammetry

#2 Optical leveling

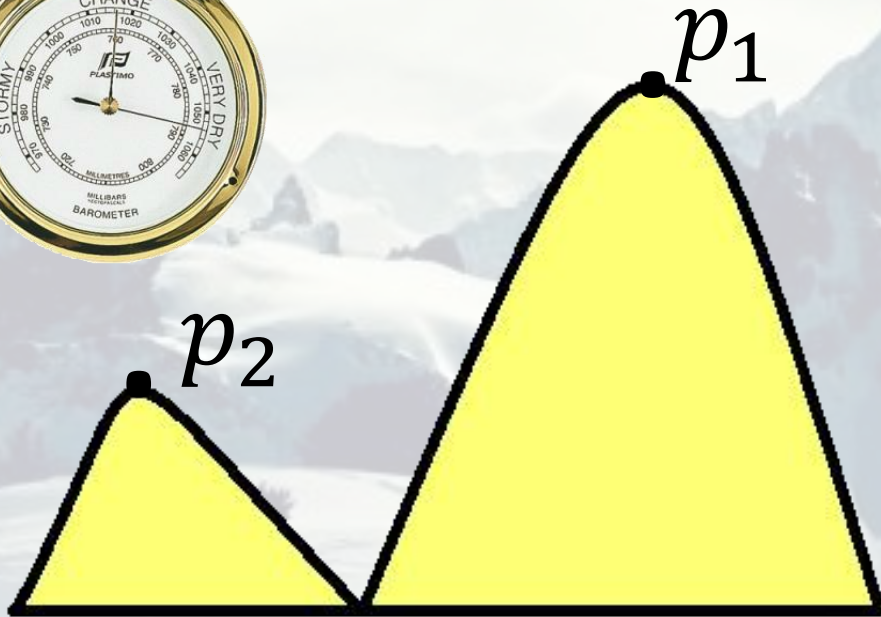

#3 Barometric
leveling

ВидеоАнализ

X (m)	Y (m)
-------	-------

Barometric leveling

$$\Delta p = p_2 - p_1$$

$$\Delta h = 18400 (1 + \alpha t) \times \lg \left(\frac{p_1}{p_2} \right)$$

$$\alpha = 0,00366 \text{ } ^\circ\text{C}^{-1}$$

#1 Photogrammetry

#2 Optical leveling

#3 Barometric leveling

Experimental part

$$p_1 = 735,25 \text{ mm}$$

$$p_2 = 734,75 \text{ mm}$$

$$t = 12^\circ\text{C}$$

$$h = 5,7\text{m}$$

#1 Photogrammetry

#2 Optical leveling

#3 Barometric leveling

Problem of this method

- The pressure dependence on other factors
- Unideal equipment

#1 Photogrammetry

#2 Optical leveling

#3 Barometric
leveling

Advantages

- Highly accurate
- Suits gentle slopes

Disadvantages

- Lots of separated steps
- 3 people are required
- Complicated set-up

#1 Photogrammetry

#2 Optical leveling

#3 Barometric leveling

Notes from our problem

- We have to use this method
- We have to take account instrumental dispersion. (We can read this information in the passport of barometer).

We can't determine Everest

- The different humidity at the peak and at the of Bay of Bengal
- The different density of air
- The different temperature and etc.

Advantages

- Simple to using

Disadvantages

- Unideal equipment
- Method can't be applied to the high mountains and to the large distances.
- Difficult mathematics

Impossibility to use in Belarus

- Elevations from 350 m give a very small time difference.
- There are a lot of trees, buildings etc.
